To my customers at home and abroad:—

Of the various classes of the best British woollens detailed below, all regular standard goods of the first manufacturers in the country, also of peasant-made homespuns, we have an abundant stock. The qualities, the same that have been known to my friends for something like forty years, and will therefore not be confounded with the merchandise offered to the public of late by some large houses at fictitious values. The clearance of many manufacturers and merchants at ruinous rates in consequence of the acute depression during the past year, attributable mainly to the collapse of the foreign exchanges and the reduced purchasing power of the community. No prices can be given as likely to be in force during 1922, but my clients may rest assured they will be adjusted to the current market value, irrespective of cost.—W. B.

### SHORT SCHEDULE OF STOCK:

**HOMESPUNS—Irish and Scotch**, peasant-made from all districts; for country wear, sport, and travelling.

**SCOTCH CHEVIOTS**; for warm, rough suits, and wraps.

**IRISH FRIEZES**; for heavy travelling and motoring ulsters.

**FLEECES**; for warm, soft, woolly overcoats, and capes.

**HOMESPUNS**; natural cream, brown, grey; and dyed colours.

**INDIAN**, Homespuns; from Cashmere, Thibet, &c.

**IRISH TWEEDS**; for hard useful wear; winter and summer.

**TWEEDS**; for ordinary town wear; various weights.

**WORSTEDS**; for business and professional wear. Dress suitings

**SERGES**; navy and black; rough and smooth; all seasons.

**CASHMERES**; for tropical and semi-tropical wear.

**TROUSERINGS**; winter and summer weights.

**FLANNEL TWEEDS**; light and porous; semi-tropical wear.

**COSTUME TWEEDS**; for ladies' country and town wear.

**OVERCOATINGS**; light, medium, and heavy.

**TRAVELLING RUGS—Irish and Scotch.**

**SHETLAND** hand-knit jumpers, jerseys, jackets, shawls, socks, &c.

**SOCKS AND STOCKINGS**; hand-knitted; Irish and Scotch.

**ORIENTAL SILKS**; for thinnest tropical suitings.

Pattern applications must be definite and descriptive of requirements, otherwise delay will result. They can only be sent to the provinces and abroad. **TERMS.**—Cash with order.

A visit to the warehouse is recommended whenever possible in order to view the extent of the stock, handle the goods, judge of their merit, and make a judicious selection.

**SHIPPERS, the TRADE, and PUBLIC** supplied at prices corresponding to extent of purchase.

None but bona fide correspondence can be attended to.

**Warehouse: 31 & 29, GREAT PORTLAND ST., W. I.**

**Branch: 93, New Bond Street, London, W. I.**

Telephone: Langham 2426. (Estd. over 70 years.) T.A.: "SELFHELP, LONDON."

# Humber

## Motor Cars

Every passing year adds new testimony to the popularity of the Humber Car. There is a general consensus of opinion among motor experts and owner-drivers that a Humber is a typical example of all that is best in motor car design and construction. Every Humber model may be depended upon to give that pride of possession which follows from the ownership of a really high-class car.

## Motor Cycles

(4½ H.P. Flat Twin)

The Humber 4½ h.p. Flat Twin Motor Cycle is a machine with a 100% efficiency certificate. Its stamina and flexibility of control are a delight to the rider, and it is one of the few 4½ h.p. machines capable of taking a side-car and passenger without taxing the efficiency of the engine. Its silence is remarkable, and considering the specification, the price is moderate.

## Cycles

There are ten different Humber Cycles, and each one is an example of sound British workmanship, scientific design and tested material. From the "Beeston" Humber (as supplied to H.M. King George V.) down to the cheapest model, they are serviceable machines—strong, light, reliable and durable.

*Full particulars sent on request.*

The border is a decorative frame made of a chain of twelve circular medallions. Each medallion contains a different illustration: a figure with a bow, a zodiac sign (Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricorn, Aquarius, Pisces), and a figure with a staff. The background of the border is a dense, repeating floral pattern.

**4 PATERNOSTER ROW**

**WHITAKER'S ALMANACK** was first published in 1868 (for the year 1869), and since 1887 there have been two editions. For 1922 the Popular Edition (in paper cover with Zodiac design) consists of 802 pages, and is sold for 3s. net; the Half-Bound Edition (in red and green cloth cover) consists of 898 pages, and is sold for 6s. net.

## PREFACE TO THE XLIV<sup>TH</sup> ANNUAL VOLUME.

वित्तिय नय संक्षेप

(1922.)

WHITAKER'S ALMANACK

In the 54th Annual Edition of "WHITAKER" an endeavour has been made to supplement the sections in which the general public find the greatest interest at the present time, and special attention has thus been paid to affairs in Ireland, to statistics relating to the Trade and Finances of the United Kingdom, to Foreign Exchanges, to Meteorological Records, and to the results of the Census of the British Empire, while the interest aroused in general historical questions by recent publications has led to the development of the Chronological Notes and to the addition of Chronological Landmarks, which provide in the space of a few pages, an "Outline of History" from B.C. 10,000 to A.D. 1921.

The articles introduced in the preceding year appear to have been received with general approbation, and they have, in consequence, been retained in the present volume; but although extra space has been provided by the enlargement of the editorial sections, it has been found necessary to omit certain articles which were formerly included.

A considerable fall in the price of paper, although unaccompanied by similar reductions in other costs, encourages the proprietors to offer the 1922 "WHITAKER" at a price showing a 20 per cent. reduction on that charged for the 1921 volume. The rebate in the price of the completed work is greater than the saving in the cost of materials used, but the proprietors hope that the favourable commercial outlook will lead to increased sales all over the globe, and thus to a reduction in the "fixed charges" to be borne by each copy of the book.

In spite of the increase in the postal rates there has been no appreciable diminution in the Editor's correspondence from all parts of the world, and many interesting and helpful suggestions have been received during the past year. While acknowledging his indebtedness for the assistance thus obligingly rendered, and soliciting a renewal of the welcome co-operation, the Editor again expresses the hope that correspondence may be posted to reach him not later than October 15th, in order that suggestions may be fully weighed and dealt with to the best advantage.

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

January 2. Day breaks at 6h. Civil twilight ends, 10h. 55m. Night begins, 10h. 5m. The length of the day from Sunrise to Sunset is 7h. 51m.

The ending of Civil twilight is here defined as the time when the Sun's centre is 7° below the horizon. Night begins and Day breaks when it is 18° below.

Jan. 3, 17h. Earth at least distance from the Sun, 91,345,000 miles. Perihelion.

Jan. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 17m. 10.66.

Jan. 14. Occultation of a Cancri. Magnitude, 4.3. See p. 8x.

Jan. 18. Saturn at a stationary point.

Jan. 18. Saturn in conjunction with ♄, 18h. 5m. ♄ 2° 56' N.

Jan. 19. Jupiter in conjunction with ♃, 11h. 32m. ♃ 0° 49' N.

Jan. 21. Mars in conjunction with ♂, 8h. 50m. ♂ 1° 34' S.

Jan. 25. Mean time taken by Sun's semidiameter in crossing the meridian, 17m. 8.90.

Jan. 27. Venus in conjunction with ♀, 10h. 15m. ♀ 5° 46' S.

Jan. 29. Mercury in conjunction with ♀, 18h. 51m. ♀ 3° 25' S.

Jan. 29. Mercury at greatest elongation, 18° 22' E.

Uranus, Jan. 1, R.A. 22h. 35m. Dec. 9° 47' S. Sets 21h. 6m.

Jan. 31, sets 17h. 16m.

Neptune rises Jan. 1, 18h. 58m. Jan. 31, 16h. 56m.

In this month the Mornings increase 57m., the Afternoons 46m.

Constellations near the South meridian at 22h.: Perseus, Taurus, Eridanus, Auriga, Orion, Gemini, Canis Minor, Canis Major.

The 24-hour Clock.—As in last year's ALMANACK, where the system was adopted for the first time, in this issue the hours of the day are numbered from 0 to 23, the hour after midnight being 0, and the abbreviations A.M. and P.M. are not used. This "twenty-four hour" method has been in use in other countries for some years, and in 1919 the Home Secretary appointed a Committee to consider and report as to the advisability of adopting this method in the United Kingdom for official and other purposes. The Committee decided to recommend the scheme. The change from the numeration of former practice is made by adding 12 to the number which indicated the hours from 1 to 11 in the afternoon and evening, so that the second hour after noon is called 13, and that immediately before midnight 23.

## APPENDIX. RIGHT ASCENSION AND DECLINATION OF THE PLANETS AT NOON.

## MORNING AND EVENING STARS

☿ MERCURY is invisible at the beginning of January, but may be seen after sunset S. of W. in the last week of the month.

♀ VENUS, being not far from superior conjunction, rises and sets nearly with the Sun.

♂ MARS is a morning star and moves from the constellation Virgo into Libra. Rises about 2 o'clock in the S.E. Magnitude +1.5 to +1.7.

♃ JUPITER and ♄ SATURN are in Virgo, and rise about midnight slightly S. of E. At 4 o'clock in the morning these two planets and Mars will lie in a line slanting upwards from the S.E. with the star Spica below and to the left of Jupiter. Magnitude of Jupiter, -2.7; of Saturn, +0.6.

The Lords Commissioners of the Admiralty have given instructions that the hours of the day shall be numbered in accordance with this method in the "Nautical Almanac," beginning with the hour for the year 1923. Until that date the astronomical day, which begins at noon, will be used as hitherto, and for that reason in the column "Mean Time at 0. Sidereal Time" hours are counted from 0 to 23, beginning at noon.

Twilight.—The illumination of the sky after the Sun has set is due to the reflection of its light to the observer from minute particles of dust, or water, or even of gases in the upper regions of the air. The time given in these pages as the end of Civil twilight is that when daytime occupations cease and the sky is dark enough for stars (not specially the planets and the brightest stars) to appear.

# FEBRUARY XXVIII DAYS.

[1922]

## Fasts and Festivals. . . Remarkable Days—Events.

SUN'S LONGITUDE 330° 4' 19d. 12h.

| DAY OF |    |   | THE SUN |       | DAYS |       |  |
|--------|----|---|---------|-------|------|-------|--|
| M.     | W. |   | Rises.  | Sets. | Day  | Night |  |
| 1      | W  | George Cruikshank, caricaturist, died, 1878.          | 7 41    | 16 46 | 30   | 133   |  |
| 2      | Th | Purification. Candlemas. Scottish Quarter Day.        | 7 40    | 16 46 | 31   | 134   |  |

Configurations of Jupiter's Satellites at 24<sup>h</sup> 45m.

## CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

February 1. Day breaks at 5<sup>h</sup> 44m. Civil twilight ends at 5<sup>h</sup> 34m. Night begins at 12<sup>h</sup> 43m. The length of the Day is 11<sup>h</sup> 6m.

Feb. 3. Jupiter at a stationary point.

Feb. 4. Neptune in Opposition. Distance, 2,704,300,000 miles.

Feb. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 7<sup>s</sup>.

Feb. 9. Venus in Superior conjunction.

Feb. 11. Occultation of A Leonis. Magnitude 5<sup>th</sup>. See p. 8.

Feb. 14, 10<sup>h</sup>. Mercury in inferior conjunction.

Feb. 15. Saturn in conjunction with  $\gamma$ ,  $\lambda$  35<sup>h</sup> 55' N.

Feb. 15. Jupiter in conjunction with  $\gamma$ ,  $\lambda$  35<sup>h</sup> 55' N.

Feb. 16. Mars in conjunction with  $\gamma$ ,  $\lambda$  35<sup>h</sup> 55' N.

Feb. 17. Mercury in conjunction with  $\gamma$ ,  $\lambda$  35<sup>h</sup> 55' N.

Feb. 20. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 7<sup>s</sup>.

Feb. 27. Venus in conjunction with  $\gamma$ ,  $\lambda$  35<sup>h</sup> 55' N.

Feb. 28. Uranus in conjunction.

Neptune rises Feb. 2, 12<sup>h</sup> 43m.; sets 7<sup>h</sup> 54m. Feb. 28, sets 6<sup>h</sup> 20m.

In this month the Mornings increase 50m.; the Afternoons 50m.

Constellations near the S. meridian at 24<sup>h</sup>: Auriga, Taurus, Orion, Gemini, Canis Minor, Monoceros, Beta Major, Argo, Cancer, Hydra.

## Note on Tables of Moon Rising, Setting, and Sailing.

—The times in the second column are those of Moonrise on the day of the month shown by the adjacent figure in the first column, the hours being counted as explained in the note on p. 24. The figures in the third and fourth columns show the time of the setting and of the sailing which next follow that rising, and these sometimes happen after midnight of the day indicated. In such cases the figures are in heavy type. It is therefore to be remembered, in using this Table, that these distinctive figures always indicate a time on the morning of the day of its line. A similar system is followed in the Tables of the planets as may be seen on the opposite page.

## Heliographic Elements.

The quantities given in the small Table at the bottom of page 2 of each month are for the purpose of determining the positions of any

## APPARENT RIGHT ASCENSION AND DECLINATION OF THE PLANETS AT NOON.

\* The days thus indicated throughout the Almanack are those on which High Tides may be expected. Strong northerly winds in the North Sea and a low barometer with heavy rains in the counties drained by the Thames will probably cause a higher rise of the river, and the low-lying riverside districts to be flooded.

### MORNING AND EVENING STARS.

☿ MERCURY will be above the western horizon for more than an hour after sunset in the first week of the month. Rises in the dawn in the latter half and sets before the Sun.

♀ VENUS rises and sets nearly with the Sun throughout the month.

♂ MARS rises before a o'clock in the A.M. by E. throughout the month. It passes from Libra into Scorpio, and on the morning of the 29th will make a close approach to the third magnitude star β Scorpii. Magnitude of Mars, +1.1 to +0.7.

♃ JUPITER and ♄ SATURN rise in the late evening. Both planets move slowly from left to right among the stars of Virgo. Magnitude of Jupiter, -1.7 to -1.9; of Saturn, +0.2.

spots that may happen to be on the Sun's disc. The second column shows the position of the Sun's axis of rotation as seen on the disc, the figures giving the arc of the Sun's circumference between the North point (which is the intersection of the celestial meridian through the Sun's centre with its edge) and the end of the projection of the axis. The third and fourth columns give respectively the solar latitude and longitude of the centre of the disc (that is of the Earth), the Sun's surface being supposed to be marked with parallels of latitude and meridians, based on the axis of solar rotation. The arc of longitude is an arbitrarily chosen solar meridian, and the direction of measurement is such that the longitude of the western edge is greater than that of the centre. The figures in the fourth column show that with respect to the Earth the Sun turns at the rate of 13° per day, or a whole revolution in 27¼ days, which is a mean value (see p. 20).

Mean Longitude of Moon's Ascending Node, March 1, 190° 31' 21".

## CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

March 1. Day breaks at 4h. 55m. Civil twilight ends 5h. 22m. Night begins 10h. 55m. The length of the Day is 12h. 45m.

Mar. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 50s.

Mar. 10. Occultation of a Cancri. Magnitude 4.7. See p. 28.

Mar. 12. Mercury at greatest elongation. 7° 30' W.

Mar. 14. Saturn in conjunction with ♄, 9h. 51m. 7 3' 8" N.

Mar. 15. Jupiter in conjunction with ♄, 2h. 43m. 11 0' 54" N.

Mar. 17-18. Occultation of ♄ Libræ. Mag. 4.4. See p. 28.

Mar. 19. Mars in conjunction with ♄, 2h. 43m. 8 4' 7" S.

Mar. 21. Sun enters the sign Aries (Spring Equinox), 9h. 49m.

Mar. 25, 17h. Saturn in Opposition. Distance, 793,730,000 miles.

Mar. 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 4' 2s.

Mar. 26. Mercury in conjunction with ♄, 1h. 51m. 9 4' 54" S.

Mar. 28. Annular Eclipse of the Sun. Visible as Partial Eclipse at Greenwich. See p. 20.

Mar. 29. Venus in conjunction with ♄, 1h. 54m. 9 0' 7" N.

Uranus, Mar. 1. Rises 6h. 54m. R.A. 2h. 45m. Dec. 8° 29' 8"

Neptune sets Mar. 1, 6h. 6m. Mar 31, 6h. 7m.

In this month the Mornings increase 65m; the Afternoons 52m.

Constellations near the S. meridian at 2h. 4: Gemini, Canis Minor, Monoceros, Argo, Lynx, Cancer, Hydra, Leo, Crater.

The Moon on its Back.—There are weather saws and proverbs conveying the idea that the position of the crescent moon relative to the horizon has some effect on, or relation to, the weather. That it will be a "dry moon," if it lies on its back so that it can "hold the water," is the gist of several apothegms; but there are others which imply a connection of an opposite kind. Actually the position depends largely on the latitude, and the young moon will be more and more on its back when setting as we approach the Tropics. The bright or "full" edge of the Moon is that nearest the Sun, and when the line joining the centres of Moon and Sun is nearly vertical, or when the Moon is almost vertically above the point

## MORNING AND EVENING STARS.

☿ MERCURY is a morning star, but rises less than an hour before the Sun.

♀ VENUS rises about the Sun, and sets within the hour after Sunset.

♂ MARS rises about an hour after midnight. It is moving from right to left, and will pass 5° north of Antares on March 6. Magnitude, +0.6 to +0.8.

♃ JUPITER rises in the early evening E. by S. It is retrograding in Virgo, with Saturn on its right, and the star γ Virginis between the two planets. Magnitude, -2.5.

♄ SATURN, being in Opposition on the 29th, is then due south at midnight, and is above the horizon from sunset to sunrise. Magnitude, +0.7.

of the horizon where the Sun has set, or will rise, it will be more especially "on its back." In northern latitudes this happens at sunset, when the Moon is young at the end of March, and at sunrise, the Moon being in its last quarter at the end of September. This position of the Moon with respect to the horizon, is therefore periodic and cannot of itself have any influence on the weather, but since the configuration is most in evidence at the time of the equinoxes, some supposed connection may have arisen because of the coincidence in time with the proverbial "equinoctial" gales.

Moon's Phases.—The half of the Moon illuminated by the Sun is continually changing. The half we see is practically always the same, the combined effect being the changing shape of the Moon that is presented. The line of separation on the Moon, between the illuminated and the dark regions, is called the Lunar Terminator.

Mean Longitude of Moon's Ascending Node, April 1, 286° 53' 0"

Configurations of Jupiter's Satellites at 24h gm.

## CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

April 1. Day breaks at 3h. 30m. Civil twilight ends 19h. 12m. Night begins 20h. 20m. The length of the Day is 12h. 51m.

Apr. 2. Occultation of Aldebaran (mag. 1.7) by the Moon in full daylight. See p. 82.

Apr. 4. Jupiter in Opposition, and at Aphelion. Distance from the Earth 412,750,000 miles.

Apr. 5. Mean time taken by Sun's semidiameter in crossing the meridian 1m. 4.4s.

Apr. 10. Saturn in conjunction with ♄, 17h. 35m. 11° 3' 19" N.

Apr. 11. Jupiter in conjunction with ♃, 2h. 31m. 11° 15' N.

Apr. 16. Mars in conjunction with ♂, 4h. 49m. 3° 5' 6" S.

Apr. 24. Mercury in Superior conjunction.

Apr. 25. Mean time taken by Sun's semidiameter to cross the meridian 1m. 5.4s.

Apr. 27. Mercury in conjunction with ♄, 9h. 42m. 0° 49' N.

Apr. 28. Venus in conjunction with ♃, 19h. 22m. 9° 4' 13" N.

April 29. Near approach of ♃ to Aldebaran. Soon after sunset the crescent Moon will be seen in the West with this 1st magnitude star below. (See note, p. 54.)

Uranus, Apr. 1. R.A. 22h. 52m. Dec. 8° 0' S.

Neptune sets Apr. 1, 4h. 31m.; Apr. 30, 2h. 50m.

In this month the Mornings increase 65m., the Afternoons 45m.

Constellations near the South meridian at 22h.: Cancer, Hydra, Leo, Leo Minor, Crater, Corvus, Virgo.

Jupiter and Saturn. — Jupiter describes its orbit round the Sun in two months less than twelve years, and in that time makes the circuit of the sky, and is in each of the Zodiacal constellations in turn. Half of these are above, half below the celestial Equator, and when Jupiter is in a southern constellation, it is low in the sky, as seen from a northern latitude, is not above the horizon for long, and is therefore in a disadvantageous position for observation. The planet is now beginning a period of southern declination, being in the following part of Virgo. It will be in Opposition on April 4, and at Aphelion on the same day, so that Jupiter is distant from both Sun and Earth, and this is a faint

### MORNING AND EVENING STARS.

☿ MERCURY in Pisces and Arries rises nearly with the Sun throughout the month. It sets after sunset in the W.N.W., in the last week, but scarcely late enough to be visible.

♀ VENUS is an evening star and will be seen in the twilight north of west. Magnitude -2.5. It moves through Arries into Taurus, and will not be far from the Pleiades at the end of the month.

♂ MARS rises about midnight near the S.E. point. It continues to move in the constellation Scorpius, leaving Antares on the right, and is low in the sky. Its brightness is increasing rapidly. Magnitude -0.1 to -0.2.

♃ JUPITER and ♄ SATURN are above the horizon from sunset to dawn, and will be seen due south not very high in the sky in the late evening. They are both retrograding in the constellation Virgo.

Opposition. Saturn was in Opposition last month (March 25), and is not specially conspicuous because it is brightest at Oppositions which happen in December; and its Ring system is at a phase such that it contributes little to the whole brightness. Both planets were in Opposition early in March of last year (1921).

Stellar Magnitude.—The numerical magnitude of a star shows its order in a scale of brightness, the terms of which are in geometrical progression. Stars just visible to the naked eye are of magnitude 6. A 5th mag. is about 100 times, a 4th mag. is a hundred times as bright as a 6th, Capella, which is 1.3 times as bright as 1st mag., are of zero magnitude (nearly). Objects brighter than this are negative, and mag. -1 is 1.6 times as bright as 0. In these pages the brightness of the planets is indicated by magnitudes according to this system.

## RAIN FALL IN MAY, 1921.

on 26 days; total fall, 1.25 inches; below the average by 0.68 inch.

The time used in these pages is Greenwich Mean Time, but the hours are numbered as explained on page 54. To convert G.M.T. into Summer Time, or the time used for general purposes in some months of the year according to Act of Parliament, 1 hour must be added.

## MONTHLY NOTES.

May 1. Holiday at London Stock Exchange.  
6. 12 George V. ends. 9. 13 George V. begins.  
ENGLISH QUARTER DAYS.—These are—Lady Day, March 25; Midsummer, June 25; Michaelmas, Sept. 29; and Christmas, Dec. 25.

Mean Longitude of Moon's Ascending Node, May 1, 187° 17' 01".

## CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

May 1. Day breaks at 5h. 43m. Civil twilight ends at 5h. 55m. Night begins at 6h. 50m. The length of the Day is 14h. 43m.

May 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 6.12.

May 7. Saturn in conjunction with ♃, 23h. 53m. 7 30' 21" N.

May 8. morn. Mars at a stationary point.

May 8. Jupiter in conjunction with ♃, 12h. 5m. 1 10' 26" N.

May 13. Mars in conjunction with ♃, 19h. 7m. 8 6' 18" S.

May 23. 10h. Mercury at greatest elongation. 22° 37' E

May 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 7.72.

May 26. Mercury in conjunction with ♃, 12h. 5m. 8 6' 20" N.

May 26. Venus in conjunction with ♃, 22h. 39m. 9 6' 30" N.

Uranus, May 1. E. A. 22h. 57m. Dec. 7° 30' S

Neptune sets May 1, 2h. 5m. May 31, 6h. 5m.

In this month the Mornings increase 43m.; the Afternoons 43m.

Constellations near the S. meridian at 2h.: Leo, Leo Minor, Crater, Hydra, Corvus, Virgo, Bootes, Libra.

Mars in Opposition.—Mars was last in Opposition on April 21, 1920, the interval between that and the date of the Opposition of this year, which is on June 10, being 76 days. This is exactly the average length of the synodic period, but because of the large ellipticity of the orbit of Mars, there is considerable variation. It may, however, be said generally that Mars is in view in alternate years, being later by two months on successive occasions. Also, because of this ellipticity, the distance and therefore the brightness of Mars varies at different Oppositions, and is brightest at those which happen in August or early September. At the Opposition next after that of this year, which will be on August 23, 1924, Mars will be excessively bright. At the Opposition of this year the planet will be brighter than it has been since the Opposition on September 24, 1899; and it will be brighter than Jupiter was at its Opposition last month.

Mars is far South of the Equator at this Opposition, and will be seen at a disadvantage from northern latitudes. It moves at this time in a south-easterly path in Scorpius, and will

Mean Longitude of Moon's Ascending Node, June 1, 285° 39' Δ.

## CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

June 1. Civil twilight ends at 21h. 7m. There is no closed night in this month in the latitude of London. The length of the Day from Sunrise to Sunset on June 1 is 16h. 13m. Its length is nearly 16h. 34m. from the 26th to the 29th.

June 4. Saturn in conjunction with ♃, 5h. 14m. 13° 0' N.

June 4. Saturn at a stationary point.

June 4. Jupiter in conjunction with ♃, 17h. 48m. 11° 10' N.

June 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 8s.

June 6. Jupiter at a stationary point.

June 9. Mars in conjunction with ♃, 16h. 24m. 8° 44' S.

June 10. Mars in Opposition. Nearest to Earth on June 10, 42,357,000 miles.

June 18. ♁. Mercury in Inferior conjunction.

June 22, 5h. 27m. Sun enters the sign Cancer (Summer Solstice).

June 24. Mercury in conjunction with ♃, 11h. 38m. 0° 23' N.

June 27. Venus in conjunction with ♃, 21h. 32m. 9° 6' S.

June 28. Meteors of a stream connected with Pons-Winnecke comet may be seen.

Uranus rises June 1, 5h. 50m.; June 30 rises, 2h. 0m.

Neptune rises June 1, 5h. 4m. June 30, 2h. 7m.

In this month the Mornings increase nearly 7m. up to the 18th, and then decrease 4m. The Afternoons increase nearly 15m. up to the 26th, and then diminish slightly.

Constellations near the S. meridian at midnight: Corona, Hercules, Ophiuchus, Serpens, Scorpius, Lyra, Aquila, Sagittarius.

The Longest Day. — Though there is but slight difference in the length of the interval between sunrise and sunset on the days about June 21, there is in general one of these days which is a few seconds longer than any other. This is the day on which the Summer Solstice falls, and at the end of a century is June 20 or 21, whilst at the beginning it is a day later, and June 21 or 22 is the longest day. The reason may be briefly stated. Because the Tropical year is not an integral number of days, the solstice falls later in the calendar year by year by six hours, nearly. It is not permitted to be very late because the interpolation of the extra day in leap year brings it back one whole day. This whole day is too much, because the solstice is

## MORNING AND EVENING STARS.

☿ MERCURY is an evening star in the early part of the month, but neither morning nor evening star at the end.

♀ VENUS will be seen in the W.N.W. after sunset. Altitude between 10° and 15° at a.s.h.

♂ MARS, now very bright, will be low down in the south at midnight in the first part of the month. It will be seen nearly S.E. in the twilight, and is approaching Antares, which rises earlier. Mag. - s.s. at Opposition on the 12th. (See note p. 42.)

♃ JUPITER will be in the south-western sky in the late twilight at altitude between 25° and 20°. Sets about midnight at the end of the month S. of W. Mag. - s.s. to - s.s. The double-star ~ Virgins is about 1° above this planet.

♄ SATURN is to the right of Jupiter. Both planets are now moving from right to left. Mag. + s.s.

later yearly by not quite 6 hours, and hence, on the whole, it falls earlier in the calendar as the century progresses, and the dates of the longest day at the beginning and end are as stated.

The principle holds for all places, but these dates apply strictly to this part of the globe because there are differences depending on latitude and longitude. These can be explained by examples. At the Equator all days are of equal length. This year the Solstice falls in the morning of June 21 (Greenwich), which is there the longest day; but it happens before midnight of June 21 in California, which is the date of longest day in that part of the world.

This acceleration of the date during the century is corrected by the omission of the intercalary day in the centennial year, which puts the date a day forward. But this does more than is necessary, and a further compensation is made by making the fourth centennial year a leap year.

Mean Longitude of Moon's Ascending Node, July 1, 284° 5' 10".

## CONJUNCTIONS, ECLIPSES AND OTHER CELESTIAL PHENOMENA.

July 1. Civil twilight ends at 23m. In this month there is no closed night until after the 21st, when the Sun will be below the horizon at midnight. The length of the Day on July 1 is 16h. 30m.

July 1. Saturn in conjunction with ♄, 22h. 23m. ♄ 2° 43' N.

July 2. Jupiter in conjunction with ♄, 2h. 35m. ♄ 6° 48' N.

July 2. ♄. The Earth at maximum distance from the Sun. Distance, 94,450,000 miles. Aphelion.

July 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 8' 4".

July 6. Mars in conjunction with ♄, 10h. 11m. ♄ 8° 30' S.

July 11. 6h. Mercury at greatest elongation, 20° 58' W.

July 17. 3h. Mars at a stationary point.

July 23. Mercury in conjunction with ♄, 9h. 47m. ♄ 4° 51' N.

July 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 7' 0".

July 27. Venus in conjunction with ♄, 12h. 21m. ♄ 2° 30' N.

July 28. Saturn in conjunction with ♄, 2h. 15m. ♄ 2° 13' N.

July 29. Jupiter in conjunction with ♄, 12h. 0m. ♄ 0° 11' N.

Uranus rises July 2, 22h. 55m.; July 31, 20h. 57m.

Neptune July 1. R.A., 9h. 7' 4m. Dec. 16° 40' N.

Meteors of the Perseid stream begin to appear in July.

In this month the Mornings decrease 34m., and the Afternoons 29m.

Constellations near the S. meridian at midnight: Hercules, Ophiuchus, Serpens, Lyra, Cygnus, Aquila, Delphinus, Equuleus, Aquarius, Capricornus, Sagittarius.

The Blue of the Sky. Light rays striking particles which are smaller than the wave length of the light are scattered or turned aside in all directions. The short waves which compose the blue and violet end of the spectrum are more completely scattered than the long red and yellow waves. Hence light passing through a medium containing a great number of such particles is left with an excess of red, while light emerging laterally has an excess of blue. The greater part of the sky appears blue because the light from it consists mainly of light scattered laterally from minute particles in the atmosphere. The smaller the particles the less intense is the light, but the greater the proportion of it that is blue. When the

### MORNING AND EVENING STARS.

☿ MERCURY is a morning star but rises in the late dawn, N.E. by E., and is scarcely likely to be visible.

♀ VENUS is an evening star and sets about 22h. W.N.W. in the first part of the month, W. by N. later. It passes a degree north of Regulus on the 13th. Magnitude, -3.5.

♂ MARS, still bright, will be low down in the S. to S.W. during the late evening. It approaches Antares but reverses its direction of motion after the 17th. Magnitude, -1.8 to -1.2.

♃ JUPITER will be at altitude about 20° in the W.S.W. at 22h. in the first part of the month. It is moving towards the star Spica. Sets before midnight. Magnitude, -1.6 to -1.4.

♄ SATURN to right of Jupiter and about the same altitude, lies between β and γ Virginis. Magnitude, +1.2.

particles are larger the proportion of blue is less as in the whiter sky of a haze. Near the horizon the sky is whiter than at the zenith because the rays of light from that region have passed through a greater thickness of the lower air where large particles are relatively more numerous. Sunset colours are reddish because the rays reaching us directly have lost much of their blue light by lateral scattering. The sky as seen from high mountains and from aeroplanes at a great height is of a deeper but purer blue because there are fewer large particles than at lower altitudes. (From the *Meteorological Glossary*.)

Mean Longitude of Moon's Ascending Node, August 1, 28° 25' 12".

## CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

August 2. Day breaks at 2h. 22m. (Civil twilight ends at 2h. 42m. Night begins, 2h. 42m. The length of the day is 12h. 59m.)

Aug. 2. Mars in conjunction with ♄, 12h. 55m.  $\delta$  8° 55' S.

Aug. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 6.12.

Aug. 7, 6h. Mercury in Superior conjunction.

Aug. 9. Neptune in conjunction with Sun.

Aug. 15, 12h. 37m. Venus and Saturn in conjunction.  $\delta$  2° 42' S.

Aug. 16-17. Aldebaran and other stars occulted by the Moon. (See p. 81.)

Aug. 24. Mercury in conjunction with ♄, 2h. 16m.  $\delta$  2° 15' N.

Aug. 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 4.65.

Aug. 25. Saturn in conjunction with ♄, 2h. 43m.  $\delta$  1° 46' N.

Aug. 26. Venus in conjunction with ♄, 2h. 3m.  $\delta$  2° 44' S.

Aug. 26. Jupiter in conjunction with ♄, 2h. 45m.  $\delta$  0° 27' S.

Aug. 27, 6h. Venus and Jupiter in conjunction.  $\delta$  2° 20' S.

Aug. 30. Mars in conjunction with ♄, 12h. 57m.  $\delta$  8° 44' S.

Uranus rises, Aug. 1, 2h. 53m.; Aug. 21, 12h. 54m.

Neptune, Aug. 1. R.A. 21h. 11m. Dec. 16° 21' N.

Meteors of the Perseid stream are expected this month, the nights of most abundance being from the 26th to the 15th, but the Moon will be in the sky throughout almost the whole of these nights.

In this month the Mornings decrease 47m., and the Afternoons 58m.

Constellations near the S. meridian at 22h. are those which were in that position at midnight in July: Hercules, Ophiuchus, Serpens, Lyra, Cygnus, Aquila, Delphinus, Equuleus, Aequarius, Capricornus, Sagittarius.

Occultation of Aldebaran.—The Moon in her monthly course passes in front of and hides the distant stars behind it. The lunar orbit is not fixed in the sky, but its nodes, or the points where it cuts the ecliptic, regress continuously, as shown by the longitude given on this and similar pages. The same stars are therefore not occulted in every conjunction, but all the stars within a band, which extends to a breadth of about 5° on both sides of the ecliptic, are liable to occultation at some time. The only first-magnitude stars within this band are: Regulus, Spica, Antares, and

## MORNING AND EVENING STARS.

☿ MERCURY is an evening star after the 7th, but sets soon after the Sun, and will not be visible.  
 ♀ VENUS may be seen long down south of west in the twilight. It passes from Saturn to Jupiter between the 12th and 27th (see opposite page), and will be near Spica on the 22nd. Magnitude, -3.7.  
 ♂ MARS will be seen W. of south in the early evening. Sets in the south-west about 23d. It is moving from Antares, which is on the right. Magnitude, -1.5 to -0.6.  
 ♃ JUPITER and ♄ SATURN set in the early evening. They will be seen in the twilight south of west at altitude 15° in the early part of the month; at 20° later. Magnitude of Jupiter -2.3; of Saturn +1.2. On the evening of the 29th Jupiter and Venus with the crescent moon near them may make a striking picture in the early twilight.

**Aldebaran.** At the present time the position of the orbit is such that the last-named is undergoing a series of occultations visible from Greenwich. There was one in daylight on April 2, and there are others in this year (Aug. 26, Nov. 4, Dec. 3) and next. On other occasions the Moon will be seen near the star (see April 29).

**Parallax.**—Because the Moon is so much nearer than the stars it is displaced on the background of the sky according to the position of the observer. This displacement is called parallax. For this reason occultations are not simultaneous for all places on the globe. Also the distances between the centres of the Moon and planets at conjunction given on page 3 of each month are as if the objects were seen from the centre of the Earth and require a correction for parallax to show the distance when the objects are viewed from the surface. The Moon is always displaced vertically downwards; by about a degree when near the horizon, and by less at greater altitudes.

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

September 1. Day breaks at 3h. 7m. Civil twilight ends at 3h. 33m. Night begins, 8h. 54m. The length of the Day is 13h. 33m.

Sept. 1. Occultation of  $\sigma$  Sagittarii. Mag. 4<sup>d</sup>. See p. 8.

Sept. 4. Uranus in Opposition. Distance, 1,778,000,000 miles.

Sept. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 17m. 4<sup>ss</sup>.

Sept. 15, 23h. Venus at Greatest elongation. 46° 24' E.

Sept. 20, 11h. Mercury at Greatest elongation. 26° 26' E.

Sept. 21, morn. Total Eclipse of the Sun. Invisible at Greenwich. See p. 20.

Sept. 22. Saturn in conjunction with  $\gamma$ ,  $\alpha$ . 17m.  $h$  1° 24' N.

Sept. 22. Jupiter in conjunction with  $\gamma$ ,  $\alpha$ . 7m.  $h$  1° 5' S.

Sept. 22. Mercury in conjunction with  $\gamma$ ,  $\alpha$ . 30h.  $Q$  5° 29' S.

Sept. 23, 20h. 10m. Sun enters the Sign Libra (Autumn Equinox.)

Sept. 24. Venus in conjunction with  $\gamma$ ,  $\alpha$ . 40m.  $Q$  7° 48' S.

Sept. 25. Mean time taken by Sun's semidiameter in crossing the meridian, 17m. 3<sup>9s</sup>.

Sept. 28. Mars in conjunction with  $\gamma$ ,  $\alpha$ . 14m.  $Q$  8° 8' S.

Note, p. 66.

Neptune, Sept. 1, R.A.  $\alpha$ . 16m. Dec 16° 1' N

Venus, which has been gibbous, or larger than half-phase during this year, has half its disc illuminated in the middle of this month.

In this month the Mornings decrease 45m.; the Afternoons 2h. 6m.

Constellations near the S. meridian at 24h.: Lyra, Cygnus, Aquila, Delphinus, Aquarius, Capricornus, Equuleus, Pegasus, Pisces.

The Solar Eclipse of Sept. 21.—As mentioned on page 20, there will be a total Eclipse of the Sun this month, the phenomenon not being visible in any phase from Greenwich. Totality will be visible from the Indian Ocean, and it has been thought advisable for an expedition to go to that region to repeat the experiment made in 1892 to seek whether the path of a ray of light is deflected when passing through the gravitational field of Sun, in accordance with Einstein's Relativity Theory of Gravitation. The method is as follows:—The stars which surround the Sun are not visible in

## MORNING AND EVENING STARS.

♂ MERCURY as last month is an evening star setting in the early twilight, nearly W. at the beginning of the month. W.S.W. later.

♀ VENUS will be at an altitude of about 6° at sunset. It sets about an hour after the Sun throughout the month in the W.S.W. at the beginning and nearly S.W. at the end. Magnitude, -3.9 to -4.2.

♂ MARS is still to be seen in the early evening sky at a low altitude, west of south in the late twilight, and sets in the S.W. This planet is now in Sagittarius. Magnitude, -0.6 to -0.1.

♃ ♄ JUPITER and SATURN set about an hour after sunset S. of W. Jupiter will be at approximately the same altitude as Venus but farther north. Magnitudes, Jupiter -1.3; Saturn +1.2 to +1.0.

daytime because of the sunlight, but when the sky is darkened during an eclipse they may be photographed. The same group of stars is also photographed in the night sky at some time before or after, and it is expected that the presence of the Sun at the time of eclipse causes small differences in the relative position of the star images on the photograph, which can be detected by measurement. The Sun will be in the constellation Virgo. A list of 22 stars surrounding it has been prepared, which may show the effect, among them being the third magnitude star β Virginie. (Mon. Not. R.A.S. Vol. LXXX., p. 62).

Large telescopes.—The Hooker telescope of the Mt. Wilson Observatory, California, with mirror 100 inches in diameter, is the largest in the world. There is a reflector of 72 inches aperture at the Canadian Dominion Observatory, B.C. The instrument of the same size as this made by Lord Rosse in 1845 is now dismantled, and its parts are in the museum at Kensington.

RAIN FELL IN OCTOBER, 1921,  
on 8 days: total fall 0.79 inch; below the  
average by 2.05 inches.

## MONTHLY NOTES.

October 1. Pheasant shooting begins.—Common  
Lodging-houses to be whitewashed in the first  
week.

3. Jewish New Year 5682.
5. Dividends due.
9. Various Licences expire.
22. Fire Insurances must be paid.
23. Quarter Sessions begin.
25. Autumn Register of Voters comes into  
force.
24. Borough Councillors to be nominated.

Mean Longitude of Moon's Ascending Node, October 1 179° 12' 31".

CONJUNCTIONS, ECLIPSES, AND  
OTHER CELESTIAL PHENOMENA.

October 1. Day breaks at 4h. 8m. Civil twilight ends at 2h. 23m. Night begins, 10h. 23m. The length of the Day is 11h. 37m.

Oct. 3. 7h. Mercury at a stationary point.

Oct. 4. 7h. Saturn in conjunction with Sun.

Oct. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 4" 32.

Oct. 15. 11h. Mercury in Inferior conjunction.

Oct. 19. Saturn in conjunction with ♄, 16h. 18m. ♄ 1° 5' N.

Oct. 19. Mercury in conjunction with ♄, 21h. 5m. ♄ 1° 38' S.

Oct. 20. Jupiter in conjunction with ♄, 16h. 26m. ♄ 1° 34' S.

Oct. 21. 7h. Venus at Greatest brilliancy.

Oct. 23. Venus in conjunction with ♄, 4h. 43m. ♄ 10° 37' S.

Oct. 23. noon. Jupiter in conjunction with Sun.

Oct. 23. 21h. Mercury at a stationary point.

Oct. 27. Mars in conjunction with ♄, 4h. 53m. ♄ 6° 53' S.

Oct. 31. 2h. Mercury at greatest elongation. 18° 38' W.

Uranus sets Oct. 1, 3h. 35m.; Oct. 31, 1h. 35m.

Neptune rises Oct. 1, 1h. 16m. R.A., 9h. 19' 30m.; Dec., 15° 45' N.

Oct. 31 rises, 11h. 18m.

In this month the Mornings decrease 51m.; the Afternoons 1h. 3m.

The Zodiacal light may be seen before dawn in the latter part of this month, the Moon being absent.

Constellations near the S. meridian at 22h.: Delphinus, Equuleus, Aquarius, Capricornus, Pegasus, Andromeda, Pisces, Piscis Australis, Cetus.

**The Harvest Moon.**—It will be seen that the interval between successive entries in the column of Moonrise is only 23 or 24 minutes near Full Moon in this month (Oct. 2-6), which is a less interval than in other parts of the column. This is the phenomenon known as the Harvest Moon, and happens this year in October.

The orbital motion of the Moon causes her to move among the stars rather rapidly from West to East, and she comes to the meridian of any place, or is due South, about 50 minutes later night by night. For this reason alone she would rise later night by night by this amount, but the time of rising (except at places on the Equator) is affected by her distance north or south of the celestial equator. In North latitude she rises earlier, with increased north Dec. There is

Day of

Time of High Water at the undermentioned Places—

## MORNING AND EVENING STARS.

☿ MERCURY is neither morning nor evening star in the first part of the month. It rises before the Sun after the 15th, and early enough to be seen by naked eye in the last week of the month E. by S.

♀ VENUS is a bright evening star, being at greatest brilliancy (magnitude -4.3) on the 21st, but sets less than an hour after the Sun in the S.W. Near Antares at the end of the month.

♂ MARS remains in the evening sky much as last month. It is low down in the south in the twilight and sets in mid-evening in the S.W. Magnitude, -0.1 to +0.3.

♃ ♃ JUPITER and ♄ SATURN being in conjunction with the Sun as shown on the opposite page are not to be seen this month. Both are in the constellation Virgo and rise in the dawn S. of E. at the end of October.

a certain period in each lunation when the Moon is moving northward rather rapidly, and this causes an acceleration which modifies the 50 minutes' retardation in the time of rising already mentioned, and in a high latitude the difference between time of rising on successive nights at this epoch of northward movement is small. This happens in every lunation, and in general passes unnoticed; but in the September or October lunation it happens when the Moon is full, and then the Moon, full or nearly so, rises about sunset on two or three consecutive nights. This phenomenon is known as the Harvest Moon. The details vary according to circumstances, and in some years the retardation on successive nights is much less than 23 minutes. When the longitude of the Ascending Node is  $\epsilon^\circ$  it is about 9 minutes in this latitude, and at the present time it is about a maximum. Also, for certain reasons, two Full Moons may have equal claims (compare Sept. 6-8), but the term is always applied to the Full Moon nearest to the Autumnal Equinox.

*Shooting Stars*.—Of all the objects that are seen in the sky the nearest to us are the meteors or shooting stars. These are believed to be small fragmentary bodies moving in space which rush through the earth's atmosphere and then incandesce by friction and are made visible to us. From observation it is found that a shooting star is about 70 or 80 miles above the earth when first seen, and 50 miles at the end of its visible path which may be 40 or 50 miles long and is traversed in a second or so. The rapid shooting stars are believed to be quite small bodies which pulverise, but occasionally bodies of larger size meet our atmosphere, the fragments of which come to earth as meteorites. These bodies congregate in swarms, the individual members of which describe similar orbits, and as they pass through our atmosphere appear to radiate

## MORNING AND EVENING STARS.

☿ MERCURY is a morning star situated in the E.S.E. at a low altitude in the dawn, and may be visible in the first week of the month.

♀ VENUS during the greater part of the month sets nearly with the Sun and rises later. It will not be conspicuous, being at Inferior Conjunction on the 25th.

♂ MARS is still low in the S. to S.W. in the early evening. Its time of setting grows later because it is moving eastward and northward. It is now in Capricornus. Magnitude, +0.3 to +0.6.

♃, ♄ JUPITER and SATURN are morning stars rising at the times shown, Jupiter in the E.S.E., Saturn more nearly E. Spica is south of the line which joins them. Magnitudes: Jupiter, -1.2; Saturn, +1.0.

from some one point of the sky by an effect of perspective, and so form a meteor shower. It has been found that the orbits of several meteor streams are identical with those of certain comets, and the conjecture is made that a comet may leave debris along its path which are seen as meteors. On the other hand, since the meteors sometimes precede, it may be that the comet is simply the thickest part of the swarm. The meteors of November, known as the Leonids, are associated with Tempel's comet (1866 I.). This stream gave remarkable displays in 1799, 1833, and 1866, which led to the study of meteoric astronomy, but the expected display in 1899 did not happen. Though the richest portion returns every 33 years, meteors are distributed all round the orbit and a few are seen each year. The Perseid Meteor Shower, which begins in July or possibly in June, and has its maximum in August, is the most interesting and attractive of the year.

Mean Longitude of Moon's Ascending Node, December 1, 175° 57' 17".

## CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

**December 1.** Day breaks at 5h. 40m. Civil twilight ends 16h. 45m. Night begins 17h. 57m. The length of the Day is 8h. 9m. From Dec. 18 to 25 the length of the Day is about 7h. 45m.

**Dec. 4, morn.** Aldebaran will be occulted by the Moon shortly before moonset. See p. 81.

**Dec. 5.** Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 10' 38".

**Dec. 6, 19h.** Mercury in superior conjunction.

**Dec. 13.** Saturn in conjunction with ♄, 18h. 45m. ♄ 0° 0' 27" N.

**Dec. 14.** Venus at a stationary point.

**Dec. 15.** Jupiter in conjunction with ♄, 6h. 6m. ♄ 2° 33' S.

**Dec. 16.** Venus in conjunction with ♄, 6h. 34m. ♄ 1° 44' S.

**Dec. 19.** Mercury in conjunction with ♄, 1h. 31m. ♄ 6° 54' S.

**Dec. 22, 14h. 57m.** Sun enters the sign Capricornus. (Winter Solstice.)

**Dec. 24.** Mars in conjunction with ♄, 6h. 26m. ♄ 4° 17' S.

**Dec. 25.** Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 11' 08".

**Dec. 31, 1h.** Venus at Greatest brilliancy.

**Uranus, Dec. 1.** R.A. 22h. 46' 37m.; Dec. 8' 38' S.; sets 23h. 26m.

**Dec. 31.** sets 21h. 33m.

**Neptune, Dec. 1,** rises 21h. 16m.; Dec. 31, 19h. 16m.

In this month the Mornings decrease 4m., the decrease continuing throughout the month. The Afternoons decrease 4m. up to the 13th, and then increase 9m.

Constellations near the S. meridian at 22h.: Andromeda, Triangulum, Aries, Cetus, Perseus, Taurus, Eridanus, Auriga, Orion.

## The Constellation of Orion.

In the middle of December, Orion, the fine star group which marks the figure of the giant huntsman, is on the meridian at midnight. The three stars which form his belt are well known, and the bright star at the north-east corner—Betelgeuse, the shoulder of the giant, is a variable star whose change of brightness is apparent to the naked eye. In the winter of 1919-20 Betelgeuse was excessively bright, frequently brighter than Rigel at the south-west corner, the brightest star of the configuration. In 1920-1 it was still above its average brightness, but there is little doubt that at some time, which cannot be predicted, it will be again seen as a dull red star in the sky, fainter than Aldebaran as it was in the autumn of 1915. It has lately been estimated

# MORNING AND EVENING STARS.

☿ MERCURY rises and sets with the Sun in the first part of the month. It is an evening star at the end, but is not likely to be conspicuous.

♀ VENUS is a morning star, rising in the late dawn in the first week of the month. It rises earlier and will be at Greatest Brilliance on the 31st. Magnitude, -4.4. (On Dec. 1. -3.4.)

♂ MARS lingers in the evening sky setting before 22h. in the W.S.W. It passes from Capricornus into Aquarius. Magnitude, +0.6 to +1.0.

♃ JUPITER is a morning star, and at 6h. in the middle of the month will be due east at altitude 15°.

♄ SATURN is also a morning star rising a hours earlier than Jupiter. It will be in the S.E. about 5h. throughout the month directly above the star Spica. Magnitude, +1.0.

that the diameter of Betelgeuse is more than 200 million miles. Below the belt of Orion is a short row of stars marking his sword. A mistiness may be seen surrounding the upper of these, which is the Great Nebula of Orion, the most glorious object of the heavens as depicted on photographs. The attempts to find its distance give results ranging from 200 parsecs (see p. 25) to ten times that amount; and it is evidently a very distant object, as are many of the stars of this constellation. Their brightness is probably due to their size and physical condition.

*The Shortest Day.*—December 22 is the shortest day, but the Sun sets earliest by Mean Time on the 13th because the Equation of Time then makes the time of sunset later day by day by about 1 minute; and after the 13th the southward movement of the Sun does not shorten the afternoon at so great a rate.

BEING THE THIRD YEAR AFTER BISSEXTILE OR LEAP YEAR, AND 13 AND 14 OF KING GEORGE V.

## Tidal Constants,

WITH THE RISE OF TIDE AT SPRINGS AND NEAPS.

THE TIME OF HIGH WATER at the undermentioned Ports and Places may be approximately found by taking the Time of High Water at London Bridge, and adding to or subtracting therefrom the quantities annexed.

NOTE.—The time thus found will be Greenwich Time for British; French and Belgian Ports, and Irish Ports, and Amsterdam time for Dutch Ports.

| Ramsgate Harbour          | sub. 2 20  | 15     | 12     | Youghal                  | add 3 37   | 12 1/2 | 9 1/2  |

EXAMPLE 1.—Required the time of high water at Aberdeen on January 24:

Time of high water at London Bridge 24. 30m. Morn.  
 Subtract tide interval ..... 0 50

Time of high water at Aberdeen ... 7 30 Morn.

EXAMPLE 2.—Required the time of high water at Scarborough on January 24:

Time of high water at London Bridge 24. 30m. Morn.  
 Add tide interval ..... 2 15

Time of high water at Scarborough ... 11 45 Morn.

It may happen that the "tide interval" to be subtracted is greater than the quantity from which it has to be

taken, in which case 24 hours must be added to the London Bridge time; the resulting difference will be the preceding day's afternoon tide where the London morning tide was used. Sometimes the sum "high water at London Bridge" + "tide interval" will exceed 24 hours; in this case the excess will be the time of high water after the midnight following.

EXAMPLE 3.—Required the time of high water at Aberdeen, January 12th a.t.:

Time of high water at London Bridge  
 on January 12th ..... 24. 27m. Morn.

+ 24 hours = 24 27

Subtract tide interval ..... 0 50

Time of high water at Aberdeen, Jan. 12th 23 37 After.

## 76 Tables for Finding the Times of Sunrise and Sunset.

THIS double entry table provides the means for finding, with sufficient accuracy for practical purposes, the times of sunrise and sunset at any place situated between latitude  $60^{\circ}$  N. and  $60^{\circ}$  S.

To use the table: In the horizontal line with the Sun's declination in the first column, and under the required latitude in the heading, there will be found the *local apparent time of sunset*. Subtracting this from *lsh.* will give the *local apparent time of sunrise*. To obtain from this the *local mean time*, the quantity in the second column on the second page of each month (which is known as the Equation of Time) appropriate to the day in question must be added to or subtracted from these apparent times of sunrise and sunset, as shown in the heading.

To find the corresponding Greenwich mean time, the difference of longitude of the place from Greenwich must be added if the place be West, subtracted if East.

The table is arranged for northern latitudes, but will serve equally well for places south of the Equator, if the declination North in the first column be considered South, and *vice versa*.

If the times of sunrise or sunset are required for any declination or latitude falling between the arguments in the table, they may be found by simple proportion.

THE TIME OF SUNSET.

The times of sunrise and sunset given in this Almanack are the times when the centre of the Sun's disc is on the visible horizon at sea-level at Greenwich, computed on the assumption that the horizontal refraction is  $34\frac{1}{2}'$ . It is doubtful whether there is a precise legal definition of sunrise and sunset. The above has generally been adopted as a correct statement, though in some Tables the instant when the upper limb, or edge, of the Sun is on the visible horizon is given as

[illegible]

the time when the Sun rises and sets. The legal question has been more concerned with the distinction between local sunset and Greenwich sunset, rather than with a precise definition. It has been held by a legal tribunal,

as would be expected, that the word "sunset" in laws and regulations must be taken to mean the time when the sun sets at the place in question, whether it be stated in local or Greenwich time.

TO FIND THE GREENWICH TIME OF SUNRISE AT CERTAIN PLACES IN THE BRITISH ISLES IN EACH MONTH OF THE YEAR.

The Table gives the number of minutes to be added to or subtracted from the time of sunrise at Greenwich, to find the Greenwich time of sunrise at the place named in the first column, on the first day of each month. The corrections to be applied on other dates and for other places in the neighbourhood of these may be inferred approximately by interpolation.

The sign + means that the time required is later than that at Greenwich. The sign -, that it is earlier.

If these Tables be considered in conjunction with a map it will be seen that the places at which the Sun rises at the same moment lie in a straight line across the map, the lines for different moments being parallel. The lines change their inclination to the meridian throughout the year. Similarly for the setting.

## Tables for Determining the Latitude

FROM OBSERVATIONS OF THE ALTITUDE OF THE POLE STAR  
OUT OF THE MERIDIAN.

The sign on the left-hand side of the *correction* is to be used when the argument is on the left, and *vice versa*; + means that the correction is to be added to the reduced altitude, and - that it is to be subtracted.

| 18                  | 1 3     | 0 53    | 0 48    | 0 47     | 0 52   | 1 1     | 1 10    | 1 19    | 1 24     | 1 24    | 1 21    | 1 14    | 1 4      |
| 20                  | 0 49    | 0 39    | 0 31    | 0 25     | 0 26   | 0 31    | 0 39    | 0 50    | 0 50     | 1 5     | 1 8     | 1 6     | 0 59     |
| 22                  | 0 38    | 0 30    | 0 21    | 0 12     | 0 8    | 0 9     | 0 14    | 0 24    | 0 35     | 0 45    | 0 53    | 0 56    | 0 54     |
| 24                  | 0 33    | 0 29    | 0 22    | 0 12     | 0 4    | 0 0     | 0 1     | 0 7     | 0 17     | 0 28    | 0 40    | 0 47    | 0 50     |

The corrections in Tables II and III. are always to be added; 1' is to be subtracted from the final result because the quantities in Table III. above have been increased by that amount in order that they may all be additive.

## Solar and Sidereal Time.

TO CHANGE INTERVALS OF MEAN SOLAR TIME INTO THE EQUIVALENT INTERVALS OF SIDEREAL TIME AND VICE VERSA.

The length of a Sidereal day is 23h. 56m. 4<sup>09</sup>s. of Mean Time. One hour of Sidereal Time is, therefore, equivalent to 59m. 50<sup>17</sup>s. of Mean Time, and one hour of mean solar time is equivalent to 1h. 0m. 9<sup>86</sup>s. of Sidereal Time. This may be expressed otherwise by saying that the Mean Time clock loses or retards 9<sup>83</sup>s. per hour on the sidereal clock, and that the sidereal clock gains or accelerates 9<sup>86</sup>s. per hour on the Mean Time clock. These quantities—"acceleration" and "retardation"—are tabulated below for the argument (common to both) in the middle columns. If the argument be considered as Mean Time, its equivalent in Sidereal Time is obtained by adding the acceleration. On the other hand, if it is considered to be Sidereal Time, its equivalent in Mean Time is found by subtracting the retardation.

| Acceleration       | Argument | Retardation        | Acceleration | Argument        | Retardation     | Acceleration    | Argument        | Retardation     | Acceleration    | Argument        | Retardation     | Acceleration    | Argument | Retardation |

IN the year 1922 there will be two Eclipses, both of the Sun.

1. An Annular Eclipse of the Sun at mid-day of March 28. Visible as a Partial Eclipse at Greenwich. The path of the Moon's shadow on the Earth, from which the Sun may be seen annularly eclipsed, stretches from Peru, where the Sun will rise in mid-eclipse at 11h. 10m. (G.C.T.), crosses Brazil and leaves the South American coast south of Para. It crosses the Atlantic and lands on the west coast of Africa, near the mouth of the river Gambia, about 1st. 10m. The track passes over the north of the Red Sea and ends in Arabia. The greatest duration of annularity (7m. 50s.) will happen where the line meets the African coast. The Sun will be seen partially eclipsed in varying degree from nearly the whole of South America and nearly the whole of Europe and Africa. Patagonia, the northern part of Norway and Sweden, and the whole of South Africa as far north as the Victoria Nyanza being excepted. In the British Isles a small partial eclipse will be seen, details for several places being given below. At Greenwich one-fifth of the Sun's diameter will be obscured at Greatest Phase, at Edinburgh about one-tenth; in these cases the eclipsed segment will be along the lower left-hand edge.

| Greenwich ..... | 13 10              | 14 15              | 15 8             | 0.20 |

II. A Total Eclipse of the Sun in the early morning of September 22 (Greenwich). Invisible at Greenwich. The path of totality begins its course in E. Africa on the Somaliland coast, where the Sun will rise in total eclipse about 3A. G.C.T., crosses the Indian Ocean to the north-west coast of Australia, and ends in the Pacific north of New Zealand. Within this track lie the Maldivo Islands south-west of India, and Christmas Island (long.  $105^{\circ} 1/4$  E.), south of the island of Java, either of which would provide a suitable observing station for the eclipse. In longitude  $105^{\circ}$  E. the duration of totality will be a maximum, nearly 6 minutes on the exact central line, but since Christmas Island is near the Northern limit of the band of totality the

duration is there only 3m. 42s. The eclipse will happen about local noon at 4h. 43m. G.C.T. and the Sun will be high in the sky at 78° altitude.

Totality may be seen from Queensland, where its duration will be between 3 and 4 minutes. The central line will pass south of Brisbane.

The circumstances of the Partial Eclipse at various places are as follows :—

### ECLIPSES OF JUPITER'S SATELLITES.

The following Table gives the times of Disappearance (D) and of Reappearance (R.) of the Satellites of Jupiter at Eclipse that will be visible from Greenwich in the year 1922. The local mean time of the phase for any place other than Greenwich may be found by applying the longitude (in time) to the times given in the Table, adding if the place is *East* of Greenwich, and subtracting if it is *West*. If Standard Time be required the zone difference is to be treated in the same way; or, in other words, the phenomena of Jupiter's Satellites are seen simultaneously from all places where the planet is above the horizon at the time.

From January to the Opposition of Jupiter (April 4) and in November and December the disappearances take place on the Western side. During this period Satellites I. and II disappear by Eclipse and reappear at the Eastern edge. From April to September the eclipse phenomena take place on the East of the planet. Satellites I. and II. disappear by occultation at the Western edge, and reappear after eclipse at the Eastern side in those months.

There are no eclipses of Satellite IV. in the list. In alternate periods of about 3 years this satellite is not eclipsed nor occulted, nor is it seen in transit across the disc of the planet. Since it is far from the primary the IVth satellite escapes immersion in the shadow of the latter when its opposition to the Sun, as seen from Jupiter is in the direction at right angles to the line of nodes of the satellite's orbit, or within  $45^\circ$  on either side of this.

The above is a list of the stars of the 6th magnitude (to mag. 6.2) and brighter that will be seen occulted from Greenwich during the year, with the times of disappearance and reappearance. The occultations if seen from other places will be in general, earlier if the place is West, later if it is East. Disappearances usually happen on the East or left-hand side of the Moon, reappearances on the West; the exact position is shown in the fourth and sixth columns, which give the angle from the North Point, or the point of the Moon's disc nearest the North Pole of the heavens, counting towards the East from 0° to 360°. Occultations of Aldebaran on several occasions are to be noted.

## ILLUMINATED PORTIONS OF THE DISCS OF MERCURY AND VENUS, 1922.

| Date.  | Mer-<br>cury. | Venus. | Date.   | Mer-<br>cury. | Venus. | Date.   | Mer-<br>cury. | Venus. | Date.  | Mer-<br>cury. | Venus. |

The position of a star is defined by its Right Ascension and Declination, which are analogous to terrestrial longitude and latitude, and have for their basis the plane of the Earth's Equator and a certain direction in that plane. Because of certain movements of the Earth these co-ordinates are continually changing. These changes are called Precession and Nutation. A star *actually* changes its position by Proper Motion (see p. 84), and *apparently* by Aberration, and in some cases by Parallax, both these causes having a periodic effect of one year. The position of a star as seen in the sky affected in this way is called the Apparent place. The Mean place on January 1, 1925, given in the Table on the opposite page is the Apparent place referred to the Equator of date (that is Precession is taken into account) with the periodic effects eliminated. For purposes of navigation and surveying it is the Apparent place that should be used, and on this page the Apparent places of the Pole star and of some other stars are given.

There are in the list certain stars which are double, or in other words, they have a close companion which may be of approximately the same magnitude as itself, or it may be considerably fainter. In general the Mean place given is that of the brighter star, and the figure affixed to the Greek letter shows whether this is the first or second star in order of Right Ascension. In the case of Castor (α<sup>2</sup> Geminorum) the second of the components is the brighter, and the place of this is given. Sirius, Procyon, and α Centauri are exceptions, and of these the Mean place given is that of the centre of the orbit, but the Apparent places refer to the brighter star. The apparent places of these three stars and of Altair are affected with a parallax: Sirius, 0.38"; Procyon, 0.33"; α Centauri, 0.75"; Altair, 0.23".

Alternative names—Polaris = α Ursæ Minoris; Aldebaran = α Tauri; Rigel = β Orionis; Capella = α Aurigæ; Betelgeuse = α Orionis; Sirius = α Canis Majoris; Castor = α Geminorum; Procyon = α Canis Minoris; Pollux = β Geminorum; Regulus = α Leonis; Spica = α Virginis; Arcturus = α Bootis; Antares = α Scorpion; Vega = α Lyre; Fomalhaut = α Piscis Australis; Altair = α Aquilæ; Markab = α Pegasi; Achernar = α Eridani; Canopus = α Argus.

The variation of light of Betelgeuse is irregular; its magnitude ranges from about 0.5 to 1.5. α Herculis is a bright red star, said to be variable by early observers; but little, if any, variation has been detected recently. β Lyrae is a variable of distinctive type ranging in brightness from magnitude 3.4 to 4.1 in a period of 13 days, which includes two minima of differing brightness. γ Argus might be considered to be of the Nova class. In the first half of the nineteenth century this star was of the 1st magnitude. By 1870 the light had diminished to about the 7th magnitude, at which it now remains. (For Stellar magnitude, see p. 39.)

THE objects of the sky, Sun, Moon, Planets, Stars, appear to us to be fixed on the interior surface of a hemisphere of which the observer is the centre. Actually the different classes of objects are at very different distances. The stars are the farthest away, and individual stars are at great and very various distances from us, and are themselves separated from one another by equally large distances. The nearest star to the Sun is nearly ten thousand times as far from it as is the planet Neptune. It is the purpose of modern astronomy to investigate the method of distribution of these bodies in space, and their possible movements. There are about 10,000 stars visible to the naked eye in the whole celestial sphere, the number including the cases where two or more faint stars close together combine to form one which is so visible. The number naturally depends on the efficiency of the observing eye and the clearness of the atmosphere, and the estimate will be less generous if stars to magnitude 6.0 and no fainter are included, which is sometimes taken as the limit of naked-eye visibility. The whole number of stars down to this limit of magnitude is 4,300, of which more than 3,000 are visible during the year from latitude 60°. By the aid of the photographic plate objects are detected and recorded which no eye can see, even with the best optical aid. One hundred millions is an under-estimate of the number of stars already photographed, and it may be supposed that this number would be much increased with increased exposure. The Yerkes telescope, whose object glass has 40 inches diameter, will just show stars of the 17th magnitude. A star of magnitude 21 has been photographed.

#### THE MILKY WAY.

It is believed that the mass of the stars we see as separate entities are arranged in space in a form which may be likened to a watch or lens. In other words, the stellar Universe is considerably flattened on both sides, the median plane being marked out in the sky by the band of star cloud of irregular shape which is seen crossing the sky on a clear night, known as the Milky Way or Galaxy. This follows from star-gauges, or counts, which show that the stars are more dense in the direction of the central plane, called the Galactic plane, than elsewhere. On either side of this the stars lie thick, but the number becomes progressively less as the distance from that plane increases, until at its poles they are relatively few. The Milky Way is seen to consist of clouds of stars distinct from the stars just spoken of, particular classes of star-clusters and nebulae, and stars of peculiar types. Formerly, this Galaxy was pictured as a girdle made of these bodies surrounding the lens-shaped system of stars, and it was a subject for discussion whether certain nebulae and star-clusters were or were not other Universes of the same type. According to a recent view (Shapley 1928) the Universe appears as an enormous all-comprehending unit. The Galactic plane is still a fundamental fact in the Cosmos, and near this lie clusters of nebulae and naked-eye stars. Our Sun and the stars readily visible to us form one of these local systems, and, so far, the scheme is in accordance with the older view, the point of difference being the existence of an actual belt of objects surrounding our special group. The Sun is not precisely at the centre of this group, but is not far distant from it. Any estimate of the size of the Universe

or of its constituent parts is little more than conjecture, but 3000 or 4000 light-years (see p. 85) was formerly taken as a minimum estimate of the length of the radius of the local system in the median plane. The estimates generally made now are much greater than this, and Dr. Shapley suggests 300,000 light years as the diameter of the Universe, which, according to his scheme, includes the distant globular clusters. It is recognised that in the space which comprises the Universe of stars there is dark obscuring matter which has been suggested as the cause of some of the dark patches in the Milky Way. As seen in the sky the Galaxy always passes through the same constellations, sharing with them the diurnal motion, but its direction bears no special relation to the direction of the Ecliptic, Equator, or horizon. Such a relation is not to be expected, for these three planes pertain only to our Sun and Earth, which are minor bodies of the Cosmos of which the Galaxy is a main outstanding feature.

#### STAR SPECTRA.

Most of the bright stars and many of the fainter have been examined with a spectroscope, and have been divided into classes according to their type of spectrum as indicated by the lines which cross them, the spectral types being named by the letters O, B, A, F, G, K, M, N. The stars of the first two classes, O and B, have spectra characteristic of helium and hydrogen, and have some affinity to planetary nebulae. Stars whose spectra range between A and F—and it is to be remarked that there is no rigorous line of division between the classes—are white or blue stars, and in their spectra broad absorption lines of hydrogen are conspicuous. In the next groups—F to G, and G to K—lines characteristic of metals appear, fine but numerous, and the stars of this class are yellow. The spectrum of our Sun falls within the group F to G. The characteristic of the spectra of the remaining classes, M (and N), is the existence of a considerable number of flutings, and the stars are red. Antares, Betelgeuse, and a Herculis are notable stars in sub-classes of this type. (See Table opposite.)

#### STELLAR EVOLUTION.

It is realised that the spectrum of a star shows not only the materials of which it is composed but also its physical condition. Stars of the M type are of low temperature, whereas those of A and B are hot stars. This has led to hypotheses of stellar evolution, but whereas it has been supposed that each star passed through stages from hot to cold as indicated by the order of spectra shown above, a recent theory affirms that a star begins its existence as a large cool body (Giant star Type M) and after increasing in temperature and density through the types K, G, F, A, B, passes with diminishing temperature and decreasing volume in reverse order through the types to become a Dwarf Star of the M type. This theory, which resembles in some respects one propounded by the late Sir Norman Lockyer, is in its present form the result of researches on stellar masses and magnitudes by Prof. H. N. Russell, of Princeton, U.S.A.

#### STELLAR MOTION.

Many, if not all, of the so-called Fixed Stars are gradually changing their positions relative to one another, the movement of each star being called its Proper Motion. Consideration of these proper motions has led to the conclusion that

The last columns show the intrinsic brightness compared with that of our Sun, which is taken as a star of apparent magnitude  $-26.75$  on the stellar scale.  $\alpha$  Centauri,  $\delta$  Cygni.—The components of these are combined. There is a small star near  $\alpha$  Centauri which is probably a member of the same system. Recently a star of the 12th magnitude has been found with a large proper motion and a large parallax, which may be added to this list (Van Maanen's star).

they are in part due to an actual movement in space of the star itself, but in part to the movement of our own Sun, which causes an apparent motion of the star in the opposite direction, this latter being called the star's parallactic motion. In this way, it has been found fairly conclusively that the Sun, and with it the Earth and planets, is moving through space with a speed of 19.5 kilometres per second towards a point on the celestial sphere not far from the bright star Vega, speaking roughly, but there are differences in the determinations of the position of this point. The Proper Motions of Stars of spectral type F and G are found to be much larger on the whole than those of other types, and it is therefore to be supposed that these classes are nearest to us. It has already been mentioned that our Sun is of this spectral type.

## DISTANCE OF THE STARS.

Though it has been said in an earlier paragraph that estimates of this kind are conjectural, it is found possible in some cases to measure the immense distances that separate the stars from us with some precision. The direct method of determination of a star's parallax, as this quantity is called, consists in measuring the minute difference of direction of the star as seen from opposite points of the Earth's orbit, which is now usually done by photographing the star and its surroundings at appropriate epochs and finding by measurement the change of position of the stars with relation to its neighbours. A spectroscopic method of finding parallax has recently been evolved. It is found that the absolute magnitude of a star, or the amount of light that it emits, irrespective of its distance, is shown by the intensity of certain lines in its spectrum, and comparison of this absolute magnitude with the magnitude as observed—which naturally depends upon the distance of the star—gives a value of the parallax. Both these methods are now being pursued with vigour, and it may be said that the distances or parallax of nearly three thousand individual stars are now known. If by any means it is possible to find out the mean

parallactic movement (see *Stellar Motion*) of a group of stars the mean parallax or distance of this group follows from a simple computation. In other words the space through which our Sun travels, which is about twice the diameter of the Earth's orbit in a year, is taken as the base-line with which to measure the distance of the stars.

If a sphere be assumed round the Sun as centre with a radius of a hundred billion miles, there are within it, so far as is known, about 20 stars. The nearest of these is the bright star  $\alpha$  Centauri and its companions. The immense distances of the stars are measured in terms of the space that light moves through in one year as unit, which in miles is 6 followed by 12 zeros, or the parsec is taken as unit, which is  $3\frac{1}{3}$  times the light year and is represented roughly by a followed by 13 zeros. A short list of some of the nearest stars is given above. It will be seen that this comprises some of the faint stars which are therefore of small intrinsic luminosity (Dwarf). On the other hand in the list of bright stars in the adjoining list there are some which are very distant, and these must therefore be intrinsically of great magnitude (Giant).

## SIZE OF THE STARS.

Even the largest of the stars is too remote to show an appreciable disc in any telescope as do the planets. By utilizing an optical principle long since proposed by Fizeau, and elaborated independently by Michelson later, it has been possible to obtain some remarkable results with the large telescope of the Mount Wilson Observatory. With a special apparatus known as an interferometer it has been found possible to measure the angular diameter of Betelgeuse, the well-known red star in Orion, as  $0''.047$ , and adopting  $0''.000$  as the parallax of the star, which is apparently not far from the truth, the diameter of the star arrived at is 215 million miles. The diameter of Arcturius measured in the same way was found to be 29 million miles. These are probably among the largest stars in the sky, and there are few so large that the instrument may be applied to them with success.

The times given are approximately and tend to be later than the middle of minimum phase.

## VARIABLE STARS.

Although the stars generally shine with unchanging brightness, there are some among them which are exceptions to this rule, and of these Algol, the star  $\beta$  of the constellation Perseus, is the best known. In general this star is of about the second magnitude, but at stated intervals of something less than three days it fades away to between third and fourth magnitude, remains so for about 20 minutes, and then regains its light. The whole eclipse occupies about 10 hours. The approximate times when this star will be at minimum in the months when it is suitably placed for observation are given in the table above. The position of Algol is given by R.A. 3h. 3m., Declination  $40^{\circ} 39' N$ .

There are variable stars of types other than the Algol. The Cepheid variables have an average period of about 7 days, and the rise from minimum to maximum takes only about one-third of the whole period, so that the decrease of light is more gradual than the increase. Stars of the  $\beta$  Lyrae type pass from minimum to minimum in about 6½ days, but are not of the same brightness at all minima, the alternate being equal. There are variable stars of long period (about 330 days) of which Mira Ceti is the most famous and others more capricious in their variation whose peculiarities can scarcely be summarized.

The variation of stars of the Algol type is believed to be caused by the partial eclipse of the bright star by a dark companion which moves in an orbit round it. A secondary minimum that has been noted in the period of variation of Algol can be accounted for by this theory. The variation of the Cepheid variables, on the other hand, is supposed to be due to a pulsation or periodic swelling and contraction of the star. It has been found that the period of  $\delta$  Cephei, the typical star of this class, is diminishing very slowly, if at all, and from this fact an inference has been drawn which assigns a thousand million years, at least, as the order of the time that we may suppose this star and therefore all stars have existed. *British Association, 1921.*

## NEW OR TEMPORARY STARS.

The phenomena known as "Novae" or "New" Stars can scarcely be classed as variable stars, for the rise to maximum, so far as is known, occurs only once in their history. Generally the Nova appears in the place of a star of faint magnitude, already catalogued or photographed, which blazes out into conflagration in the space of a

few days or hours. The great brilliancy is almost as short-lived as the increase in light, and then follows a fall, more or less steady, and in a few months the object emits, perhaps, 1 per cent of its light, whilst in a decade it has fallen to its original condition and luminosity. As these changes go on the spectrum undergoes equally remarkable variations. The few observations that have been made during the increase of brightness show a spectrum of the ordinary type crossed by dark lines which are much displaced from their normal position. Just as the maximum light is reached the spectrum is full of bright bands flanked by dark lines on the side of the shorter wave length towards the violet. The lines of hydrogen are most conspicuous, but helium is present, and other bands can be identified with enhanced lines or lines which are produced in the laboratory when metallic vapour is very strongly excited to luminosity by a powerful electric spark. Later on as the light begins to fall the characteristic nebular lines in the green and violet make their appearance and become the most conspicuous feature of the spectrum while the other lines fade away. At a still later stage the spectrum resembles that of the nucleus of a planetary nebula or of one of the Wolf-Rayet stars which are found here and there in the Milky Way. There are records of the appearance of these temporary stars as early as 134 B.C. There were none between 1690 and 1848, but, since the latter date there have been 25 visible to the naked eye as under. With the exception of the second, all have been in the region of the Milky Way. Novae which have not been of naked eye visibility are not infrequently found on photographs.

STAR CLUSTERS AND NEBULÆ.

Among the other apparently solitary stars we may notice groups of stars gathered close together, sometimes easily separable into individual stars, others that can only be separated in the most powerful telescopes, and some that appear as unresolvable patches of light; the latter are called nebulae, and were aptly described by Sir William Herschel as "shining fluid." A short list of the more interesting of these various objects is given herewith.

| No. in New General Catalogue. | Messier's or Herschel's Number | R.A. 1900. | Declination 1900. | Constellation.  | Appearance.  |

Besides the obvious separation into these two classes there is further subdivision. There are loose clusters of stars of which the Pleiades is the best known example, and there are globular clusters whose character is sufficiently described by the name. Among the nebulae there are some which present a nearly uniform disc of light and are known as planetary nebulae, and analogous to these are some which are dark in the centre and are called annular or ring nebulae. But beyond this the spectroscope divides the nebulae into two great classes. The first spectroscopic observation of a nebula, made by Huggins in 1864, showed a spectrum of one bright line only, which indicated that these bodies, or at least some of them, are constituted of glowing gas. Later investigation showed that the spectra of some nebulae are continuous, from which it may be inferred that these are in a later stage of progress, assuming the evolution of celestial bodies from a primitive nebula. The nebulae with continuous spectrum are called "white" nebulae, in distinction to those with bright line spectra, which are "green" or gaseous. Photography has brought the means of studying the number and form of these objects in great detail, and it is found that the white nebulae are as a rule of a spiral form, and that there are many thousands of them. The gaseous green nebulae are in a small minority. The great nebula in Andromeda is a notable example of the spiral class. Its spectrum is perfectly continuous, unmarked by any lines or bands, either bright or dark, and its shape is that of a convoluted mass seen edgewise. The position of these bodies and the method of their distribution in space brings problems for solution. Referring to the shape of the Stellar Universe of which the Milky Way marks the median plane, as mentioned in a previous note, the nebulae seem in general to avoid the Galaxy and are found to congregate in the region of the galactic poles, especially of the

northern. The globular clusters lie almost exclusively in one hemisphere of the sky, whose centre lies in the Milky Way near the constellation Sagittarius, whilst the star clusters other than globular lie closely along the Galaxy. Whether the Spiral nebulae are "Island Universes" or aggregations of stars similar to, but quite outside of the local aggregation of which our Sun is a member, or whether they form a part of the latter, has been much discussed. Herbert Spencer argued that because the stars and nebulae seem to avoid one another, they must, therefore, be parts of one system, or otherwise there would not be such a complete separation.

## The Solar System.

THE Sun is one of the millions of stars that make up the Universe, and, so far as human knowledge goes, is not unlike many of the stars we see in magnitude and constitution. It is surrounded by a family of smaller bodies of which our Earth is one, and the Solar system, which is only a minute detail in the structure of the Universe, is the observing station from which we look out in all directions across the great distances which separate us from the other members of the stellar system.

The Solar or Planetary system consists of the Sun, with eight major planets and a thousand minor planets, or asteroids, circulating round him at varying distances in oval-shaped orbits. Six of the major planets have smaller bodies circulating around them, so that each forms a separate system, but all the bodies receive their light and heat from the Sun.

The periodic comets which return to perihelion at regular intervals, since they move in elongated elliptical orbits of which the Sun is at one focus are also members of the Solar system, but shine partly by their own light.

The plane of the Ecliptic in which the Earth moves round the Sun (see p. 97) is used as a fundamental plane of reference. The other planets move, at varying distances from the Sun, in planes inclined but little to the plane of the Ecliptic, and describe orbits in periodic times which are connected with the distances by a certain relation known as Kepler's 3rd law. The squares of the periodic times vary as the cubes of the semi-major axes. Following are given brief notes on each of the bodies which make up the Solar system, with details of their sizes, distances from their primary, and periodic times in tabular form. The time of rotation about the axis, or the length of the day of the planet, is added where this is known.

### THE SUN.

The surface of the Sun presents a mottled appearance, and on it black spots appear sporadically. The nature of these is not known with certainty, but it was formerly supposed that they are at a lower level than the surrounding surface, the photosphere, though some modern views assert that spots are due to a central uprush. They are apparently signs of some solar activity which influences the magnetism of the Earth, for the coincidence in time between certain variations of terrestrial magnetism and of magnetic storms on the earth with the appearance of sun-spots is too marked to be fortuitous. It is suggested that the connection is made by stream-like emanations of corpuscles from the Sun which envelop the earth. The spots vary in size and number, and their total area reaches a maximum about every eleven years. They seldom appear more than  $30^\circ$  of latitude from the solar equator, north or south, and the spotted regions converge towards that equator as the time of minimum approaches. A record is kept of the appearance and positions of the spots on the solar disc, and from these positions the latitude and longitude of the spots on the Sun's surface (Heliographic) can be computed. Elements necessary for this computation are given on page 2 of each month. The Sun rotates on its axis in about 25 days 8 hours, which is shown by the apparent movement of the spots. They cross the visible disc from the eastern to the western edge in 13 or 14 days, the average period of the Sun's rotation with respect to the

Earth being  $27\frac{1}{4}$  days, because of the orbital movement of the Earth in the interval. Like Jupiter, the Sun appears not to rotate as a whole, the period of rotation being different in different latitudes. The Equator makes a sidereal rotation in less than 25 days, whereas the period for latitude  $35^\circ$  is nearly 27 days. The number and size of the spots in 1892 continued to decline, but a large group of spots quite on the Solar Equator in May was a feature of the year.

### DATES OF SUN-SPOT MAXIMA AND MINIMA.

| Maxima. |        | Minima. |        |
|---------|--------|---------|--------|
| 1805.2  | 1870.6 | 1810.6  | 1867.2 |
| 1812.4  | 1883.9 | 1813.3  | 1878.9 |
| 1820.9  | 1894.1 | 1833.9  | 1889.6 |
| 1837.2  | 1906.1 | 1843.5  | 1901.7 |
| 1848.1  | 1917.7 | 1856.0  | 1913.1 |
| 1860.1  |        |         |        |

When the intense light of the Sun is shut off by the interposition of the dark body of the Moon in a total solar eclipse, certain red prominences are seen projecting from the Sun's edge, which consist of masses of glowing hydrogen gas arising from the chromosphere. Sometimes these are of remarkable shape and extend to enormous heights, occasionally being detached from the body of the Sun. In the lower strata of the Sun's envelope are found the vapours of many metals, known by their characteristic lines shown in the spectroscope. Another appendage to the Sun outside the chromosphere, called the Corona, can only be seen during total eclipses. The lower portion of the corona consists of a pale green light containing hydrogen, the upper is a beautiful mass of silvery white light, in form of feather-like plumes, with dark spaces between, which have been traced from the Sun's edge to a distance as great as twice the Sun's diameter. Occasional streamers of the corona have been traced to a greater length than this. The corona does not retain a constant form, but appears to vary in shape and extension according as the eclipse occurs at the period of maximum or minimum of Sun-spots. Solar eclipses are only seen total at places where the shadow of the Moon falls, and an eclipse is partial at localities off this line of totality, because the change in the observer's position puts the Moon out of the direct line joining her to the Sun. Total eclipses of the Sun are rare in this country. There will be an eclipse in June 1897 which will be momentarily total from a track running across North Wales and North-West Yorkshire. Last year an annular eclipse (when the Sun's disc was not quite covered, but a ring of light was left round the eclipsing Moon), was seen from a region in the North of Scotland. The chief eclipse of this year is the Total Solar Eclipse in September which it is proposed to observe from a station in the Indian Ocean (see p. 58).

### MERCURY.

Mercury is the nearest planet to the Sun, and the smallest in the system. Because it moves in an orbit between the Sun and the Earth this planet can never be seen far from the former body, and is sometimes to the West, sometimes to the East of the Sun. In the former case Mercury appears as a morning star and in the latter as an evening star. The extremes of these apparent excursions are technically known as Elongations, and the times and distances,

measured by the angle included between the lines which join the Earth to the Sun and the planet respectively, are given in the third page of each month. The great ellipticity of the orbit of Mercury causes the amount of these Elongations to vary considerably, and they may be as small as  $16^\circ$  or as large as  $29^\circ$ . The period of revolution round the Sun—in other words, Mercury's year—comprises 88 solar days, and he turns on his axis either in the same time, and therefore always presents the same face to the Sun, like the Moon with respect to the Earth, or in about 25 hours. Mercury shows phases to the Earth—like the Moon in her first quarter if the elongation be in the East, and like her last quarter if in the West.

#### VENUS.

Venus, which is nearly twice as far from the Sun as Mercury, is almost exactly the same size as the Earth. Her apparent movement with respect to the Sun is similar to that of Mercury, except that, being farther from the Sun, and nearer to the Earth than her smaller neighbours, the angles of Elongation exceed those of Mercury, and extend to  $47^\circ$ . The disc of Venus is not telescopically interesting, for owing to her dense cloud-laden atmosphere very few markings are visible, and this renders a determination of her axial rotation uncertain. By some astronomers her day is believed to be very nearly equal to that of the Earth, whilst others have concluded that it is equal to the year of Venus, or, in other words, that the planet always presents the same face to the Sun. Venus has epochs of great brilliancy when she appears as a beautiful crescent like the Moon when about 5 days from New. Such epochs will occur in the current year in October and December. The brightness is not the same at all the maxima, for this varies periodically and the morning maximum in December of this year is a specially bright one.

#### MARS.

Mars, the first planet whose orbit is exterior to that of the Earth, is a little larger than Mercury and considerably smaller than Venus and the Earth. Details of his distance and period will be found in the table. Mars is in opposition at intervals of about two years, because it moves at a rate not greatly different from that of the Earth, and will be in this configuration, and therefore conspicuous in 1922 (see p. 42). Mars, like Mercury and Venus, exhibits phases, but in a much less degree than those planets. His disc departs from exact circular form, or is gibbous only to the extent of one-eighth of its diameter. The other superior planets are too far away to show any very appreciable phase, though traces of it are sometimes to be detected in Jupiter.

Unlike Mercury and Venus, Mars exhibits many well-defined markings, which enable his rotation period to be well ascertained; there are, besides, white spots at the poles of rotation. These are supposed to consist of snow, and when it is summer to the Martians in the northern hemisphere, the white spot about that pole dwindles considerably in extent, if it does not disappear entirely, which it does rarely. The remainder of the disc is divided into greyish and ruddy areas, which have been called seas and lands. The Maria are not now generally considered to be oceans, but are usually regarded as marshes or areas covered with some sort of

vegetation. These areas are seen to change their colour and intensity with the Martian seasons very much as our vegetation would appear to do if viewed from a celestial neighbour. Certain fine, dark, straight markings seen across the ruddy areas have been named "canals," perhaps a little unfortunately, as it has been taken to imply that they are of manual construction, but for this there is no sufficient evidence or proof (see p. 43).

#### MINOR PLANETS.

Between the orbits of Mars and Jupiter a large number of small planets have been discovered, and every year a considerable number are added to the list. At present the total number known is about a thousand, and there may still be thousands awaiting detection. The four largest, found in the early years of the 19th century, are—Ceres, 485 miles; Pallas, 304 miles; Juno, 128 miles; and Vesta, 243 miles in diameter. Vesta is the brightest though not the largest. In recent years the discoveries have been of much smaller objects, and it is probable that some of them are not more than from 10 to 20 miles in diameter, and are perhaps nothing more than great masses of rock flying round the Sun.

The periodic times of their revolutions vary considerably, and an average may be taken as 1,600 days, or  $4\frac{1}{2}$  years. Some of the orbits are very oval, and the inclination of their planes to the Ecliptic has considerably different values. The inclination of Pallas is  $35^\circ$ , whilst that of Juno is only  $13^\circ$ . One of these small bodies, named Eros, at some oppositions approaches nearer to the Earth than Mars does at any time, and this affords a good opportunity for determination of the solar parallax. Oppositions happen at intervals of about  $2\frac{1}{2}$  years, the circumstances being very different at the different occasions. There was one in September, 1921, when Eros was distant about 60 million miles; there will be another and a more favourable one in 1924, and there will be a very close approach at the opposition in 1931.

#### JUPITER.

The next planet in order from the Sun, Jupiter, is the largest in the system, and has a diameter eleven times that of the Earth. Its density, however, is only  $\frac{1}{4}$ th that of the latter. On viewing Jupiter through a telescope it will be seen that the disc is not circular, but its form, an oblate spheroid, is believed to be due to the rapid axial rotation, which causes a flattening at the poles and bulging outwards at the equator. The same effect is produced on all the planets in more or less degree. Jupiter has four principal satellites about the same size as our moon, which were the first celestial objects discovered with the telescope, Galileo having observed them in the year 1610. The planes of their orbits are but slightly inclined to that of Jupiter about the Sun, and in consequence these bodies which shine by the light of the Sun, are eclipsed every Jovian lunation, except Satellite IV., which escapes under some circumstances (see p. 39).

#### THE GREAT RED SPOT ON JUPITER.

This may be considered the most remarkable and the best observed planetary feature of modern times. There is record of an observation of a spot by Hook in 1664, which may have been an early appearance of this, but the first modern observation was by the Rev. W. R.

Dawes when he figured it in the form of an ellipse resting on the south equatorial belt of Jupiter on Nov. 27, 1837. It came again into prominence in 1878 and the following years. A curious bay or hollow on this belt has been visible since 1831; and if we accept this as identical with the one now intermittently perceptible (which includes the red spot), then the rotation of this object during the 83½ years from 1831 to 1918 was  $ph. 55m. 26.9s.$  from more 76,000 rotations.

In the early months of 1919 the great red spot and its immediate surroundings underwent some surprising changes. The bay or hollow in the S. side of the southern equatorial belt disappeared, and the red spot seemed almost obliterated. The south tropical disturbance, visible since 1901, consisting of an extensive dusky marking reaching halfway round the circumference of Jupiter, and situated in the usually bright zone between the southern side of the south equatorial belt and the south temperate belt, apparently disappeared. The apparition of 1919-20 was again remarkable. The features mentioned above, the Bay, the Red Spot Hollow, and the S. Tropical disturbance, had all reappeared, and the Red Spot, though without its colour, was well defined and of abnormal length.

At the opening of the year 1922 the position of the latter object will be approximately  $116^\circ$ , or a little more than 3 hours, preceding the zero meridian (System II.) of Jupiter, and if the previous motion is continued, the values above given will increase at the rate of about  $4''$ , or  $6\frac{1}{2}$  minutes per month. There is much to repay a careful study of the portion of Jupiter's surface referred to through adequately powerful telescopes. The transits of the zero meridian (II.) of the planet on various dates in 1922 will be as under in astronomical time:—

| 1922.       | h. m. | 1922.       | h. m. |
|-------------|-------|-------------|-------|
| Jan. 3..... | 19 27 | May 1.....  | 16 38 |
| " 24.....   | 21 46 | " 7.....    | 11 37 |
| Feb. 5..... | 21 39 | " 28.....   | 13 56 |
| " 20.....   | 19 1  | June 2..... | 13 5  |
| Mar. 6..... | 20 38 | " 9.....    | 13 53 |
| " 31.....   | 16 7  | " 28.....   | 14 37 |
| Apr. 4..... | 19 23 | July 3..... | 13 46 |
| " 21.....   | 18 28 | " 27.....   | 13 43 |

The times for other dates may be found by adding periods of  $ph. 55m. 40s.$

*Note.*—Two systems are in use for defining the positions of markings on Jupiter. In System I., which pertains to the rapidly moving Equatorial Zone of the planet, the period of rotation is taken as  $ph. 50m. 30s.$  System II. applies to the Temperate Zones, and in this the time of rotation is  $ph. 55m. 40.63s.$

It is to be remembered that in March, 1922, the Red Spot will come to the Central Meridian of Jupiter about  $ph. 8m.$  before the times given in the foregoing list, and that this interval of the precedence of the spot will probably increase by about  $6\frac{1}{2}$  minutes per month. The motion of the spot is, however, not uniform, but irregularly variable, so that prediction of its true place can be only approximate.

#### SATURN.

The sixth major planet in order from the Sun is unique in appearance because of its encircling ring-system, which renders it magnificent as a spectacle and an interesting object for telescopic observation. The system consists of three bright rings and an inner dusky ring through which the

body of the planet can be seen. The rings appear to be flat annular discs of extreme thinness, inclined at an angle of  $26^\circ$  to the plane of the Ecliptic, and it is shown that neither of them can be a coherent mass or in one piece, either solid or liquid, as in that case it would be difficult to account for their stability. They probably consist of an immense number of minute bodies revolving like satellites round the body of the planet. Of the three bright rings the middle is the brightest. Twice during Saturn's period of revolution of  $29\frac{1}{2}$  years, the plane of the Ring passes through the Sun's centre, which happened in 1907 (July 26) and in 1921 (April 12). Belts like those on Jupiter, but of not so pronounced a character, are seen on Saturn. His figure shows a bulging at his equator, the ratio of the polar to the equatorial diameter being as 14 to 15.

Saturn has ten satellites, situated outside the rings; some of the former are visible in telescopes of low power. Titan, the largest, is about one and a half times the size of our moon, whilst Iapetus is about the same size as our satellite. The tenth satellite, Themis, has been observed once only since its discovery.

#### URANUS.

Discovered by William Herschel at Bath in 1781, this planet is only just visible to the naked eye. In a telescope Uranus may be distinguished from the stars around by his disc, which is obvious though less than  $4''$  in diameter, and by the quality of his light, which is less piercing than that of the stars. Very little is known about his surface markings, but a rotation period of 10 hours 49 minutes has been inferred from the observed variability of his light, which has been supposed to be due to some specially reflective spot coming into the Sun's rays. A determination of the rotation period by the spectroscopic method agrees with this. Uranus will be favourably situated for observation in the autumn months in 1922.

#### NEPTUNE.

This planet, placed on the confines of the Solar system, is a small telescopic object of about the 8th magnitude. He will occupy a position in the E. part of Cancer, and may be observed with best effect in the early months of this year.

#### THE MOON.

Neither Mercury nor Venus, so far as is known, has a satellite; the one satellite of the Earth is the Moon, which is quite familiar to us. The mean distance of the Moon from the Earth is about 239,000 miles—near enough for us to get a more complete knowledge of its surface conditions than we can of any other member of the Solar system. When viewed through a telescope, charts of very great accuracy can be made of her surface, as she has no appreciable atmosphere to obscure the more delicate markings. Only one side of the Moon is seen, and from this fact we infer that she must turn on her axis in the same time that she moves round the Earth. As there is no sign of water or vapour on the disc, and consequently no atmosphere, the surface must be exposed to the most violent changes of temperature: in the lunar day of half a month it must be heated to a very high temperature, and in the other half subjected to cold equal to that of interstellar space. Her diameter is rather more than 2,160 miles, and her rate of motion through the firmament  $23' 20' 35''$  per day and  $3s. 56''$  per hour. Thus she travels over

a space slightly exceeding her own diameter in one hour. The actual time she takes to move around the Earth is *syn.* 7h. 43m. 11<sup>s</sup>.4, but the time from one New Moon to another is *syn.* 29h. 44m. 3s. When seen through a telescope the surface of the Moon presents many objects of great beauty and interest. A small instrument will show the chief "seas," plains, mountain ranges, ring-plains, and crater-pits.

Prof. W. H. Pickering has recently been making some interesting investigations with reference to supposed "seasonal changes occurring in certain lunar craters." He finds distinct evidence that this takes place in regard to various objects which he has specially studied. He admits, however, that the explanation of such phenomena are difficult, though vegetation appears to be a less improbable theory than any other. Sir W. H. M. Christie supplemented Prof. Pickering's observations of these changes, and papers detailing the results may be consulted in Monthly Notices, R.A.S., Vol. LXXXI., pp. 451 and 460 (1921).

When the Earth passes between the Sun and Moon, the Earth's shadow sweeps across the Moon and causes a lunar eclipse, which may be either total or partial as in the case of solar eclipses, but there is the difference that the phase for lunar eclipses is the same for all observers where the Moon is above the horizon at the time. The obscuration of the Moon's disc is hardly ever complete, but because the Sun's light is scattered by the clouds in the Earth's atmosphere, the Moon appears usually as a copper-coloured disc, the precise shade being different at different eclipses. It will be understood that solar eclipses can take place only at New Moon, and lunar eclipses only at Full Moon.

In a note on page 62 it is explained why the Full Moon, near the time of the Autumnal Equinox, rises at nearly the same time, about sunset, on several consecutive evenings. Because in earlier times it was thought that this was specially ordained to facilitate the ingathering of the crops the phenomenon was called the Harvest Moon. The Full Moon which follows is called the Hunter's Moon.

### A FEW OF THE CHIEF LUNAR FORMATIONS.

*Wedge-shaped Valley of the Alps.*—Near the central line of disc, towards the north, a cleft 83 miles long and 3½-5½ miles broad.

*Apennines.*—An extensive mountain range somewhat similar to terrestrial features. Visible to naked eye when projecting into the dark part of the disc. Length, 450 miles; highest summit (Huygens) reaches 18,000 feet.

*Aristarchus.*—A lunar crater in N.E. quadrant. The brightest object on the Moon. This crater is visible as a luminous spot when all the surrounding region is involved in shadow.

*Mare Crinum.*—A dark grey oval plain visible to naked eye near W.N.W. limb of Moon. Extends 280 miles N. to S. and 354 miles E. to W. Well seen five days after new or a few days after full.

*Mare Serenitatis.*—Lies S. of the Moon's centre, and extends over 428 miles. A nearly circular dark plain. Contains a crater, Linne, formerly suspected of change. This *mare* is visible to naked eye.

*Clavius.*—One of the finest craters on the Moon, and about 142 miles in diameter. Situated on S. limb.

*Tycho.*—Towards S. limb. Has been called "the metropolitan crater of the Moon." A fine crater 54 miles in diameter and 16,600 feet deep. Central hill nearly a mile high. Tycho is the centre of a remarkable system of bright rays radiating from it, and they are very conspicuous at the time of full moon. In its region (S. limb) the Moon's surface is so studded with craters that it resembles an immense honeycomb.

### COMETS.

In addition to the planets, there are other interesting objects belonging to the Solar system, called comets. Some of these revolve in elliptical orbits, and return at intervals, which in the case of those that have been observed range from 3½ to nearly 80 years, whilst a few other computed orbits show periods as large as a million years. Other comets move in parabolic courses and apparently do not repeat their visits to the Sun.

Comets revolving around the Sun in comparatively limited times are not very numerous, but our knowledge of them is constantly becoming more comprehensive and accurate. These small returning comets revolve in periods from 3½ to 9 years, and deserve special notice, as their orbits are well known and predictions of their reappearances can be accurately made in many cases.

Their paths extend outwards to the position where Jupiter performs his revolution, and from this circumstance they are termed Jovian comets.

### ELEMENTS OF THE SOLAR SYSTEM.

|           | Mean Distance from Sun. |                    | Sidereal Period. | Synodic Period. | Inclination of Orbit to Ecliptic. | Diameter.  | Mass compared with Earth. | Period of Rotation on Axis. |
|-----------|-------------------------|--------------------|------------------|-----------------|-----------------------------------|------------|---------------------------|-----------------------------|
|           | Radii of Earth's Orbit. | Millions of Miles. |                  |                 |                                   |            |                           |                             |

The following are the approximate dates when some members of this family should return to perihelion in 1922 and 1923, but the actual appearance of several of them is doubtful:—

|       | Expected<br>Return. | Period in<br>Years. | Name of Comet and<br>Year of Discovery |
|-------|---------------------|---------------------|--|
| 1922. | April .....         | 5.398...            | Barnard ..... 1884                     |
|       | June .....          | 6.366...            | Taylor ..... 1915                      |
|       | September .....     | 6.453...            | Perrine ..... 1896                     |
|       | October ...         | 6.480...            | Daniel ..... 1909                      |
|       | November .....      | 6.480...            | Spitaler ..... 1890                    |
|       | November .....      | 5.456...            | Brorson ..... 1846                     |
| 1923. | May .....           | 6.647...            | Giacobini ..... 1896                   |
|       | June .....          | 6.202...            | Coggia ..... 1873                      |
|       | December .....      | 7.418...            | Denning ..... 1894                     |
|       | December .....      | 8.534...            | Swift ..... 1880                       |

The comets of this class move in elliptic orbits not much inclined to the Ecliptic. Without exception they travel in *direct* courses, and in these respects present an analogy to the planets, but of those that move in very long ellipses, or parabolas, about two-thirds have a retrograde (westerly) motion.

There are other families of comets, none so large as the Jovian, named respectively from the planets Saturn, Uranus and Neptune, for reasons similar to that given above. Halley's comet belongs to the Neptunian family.

The most probable date for the return of Di Vico's comet of 1846 was November 1921, but as the period is uncertain by a or 3 years a later return is possible. It is therefore possible that it may re-appear in 1922.

The periodic comets, Pons-Winnecke and Encke, were observed at their return in 1921, and two non-periodic comets were discovered (up to Nov. 1). A bright object observed at the Lick Observatory on August 7, near the Sun when setting, might have been a comet. There is slight corroboration of this observation in England.

In the life of a comet the tail sometimes appears to undergo very rapid and curious changes. From examination of the spectrum of the head, comets appear to consist of carbon in various forms, and cyanogen has also been detected. Secondly, there are bright metallic lines due to sodium, magnesium and iron which appear only when the comet is near perihelion, and in some cases have become very strong upon close approach to the Sun. The spectrum of the tail shows certain characteristic bands that

are due to carbon monoxide of very low density. Generally a continuous spectrum is shown as a background to the bright lines, from which we infer that a part of the comet's light is due to reflected sunlight. Comets' tails are generally directed away from the Sun, as if acted upon by some repulsive action—perhaps light.

### METEORS.

Another class of objects which belong to the Solar system are the meteoric streams, giving rise to occasional showers of meteors, falling

dant as to form striking phenomena. The year 1926 was notable because of a remarkably abundant and previously unknown stream on June 28, which had a distinct connexion with Pons-Winnecke's periodical comet, the orbits being nearly the same. This comet returned to perihelion on June 12, 1921, but the attraction of Jupiter had so disturbed the comet's orbit that it passed outside the earth's path by about two million miles, and the expectation of a brilliant meteoric shower was not realized. Some fine meteors were, however, observed on June 27, 28, and the few following nights at Bristol and Stowmarket. They were directed from radiant points in Draco, nearly conforming with that of particles radiating from Pons-Winnecke's comet, and probably were derived from that object. Meteorites are composed of terrestrial elements, iron, chromium, magnesium, and nickel being in large proportion.

#### DURATION OF LIGHT AND DARKNESS.

THE second column of the first page of Calendar for every month contains a small diagram showing the amount of Darkness, or on the period of moonlight and sunlight during the twelve hours from 18h. to 6h. These small diagrams have four divisions, each representing three hours, and a division is left unblackened if the moon or the sun is above the horizon for at least half of the period represented. The diagrams used for the greater part of the year

are  which scarcely require explanation. In the summer when the sun is above the horizon for more than half the first and last intervals, these reduce to 

EXAMPLES.—From Jan. 10–Jan. 15 1922, there is moonlight from 18h. till 6h. (approximately), but from Jan. 23–Jan. 29 there is no moonlight.

#### APPARENT DIMENSIONS OF SATURN'S OUTER RING, 1922.

|---------|-------------|-------------|----------|-------------|-------------|----------|-------------|-------------|---------|-------------|-------------|
| Jan. 7  | 40' 33"     | +4' 74"     | April 13 | 43' 64"     | +3' 33"     | July 18  | 37' 81"     | +2' 58"     | Oct. 22 | 35' 36"     | +5' 72"     |
| Feb. 8  | 42' 49"     | +4' 77"     | May 15   | 42' 09"     | +2' 70"     | Aug. 19  | 36' 28"     | +3' 72"     | Nov. 23 | 36' 47"     | +6' 79"     |
| Mar. 12 | 43' 80"     | +4' 80"     | June 16  | 39' 50"     | +2' 59"     | Sept. 20 | 35' 50"     | +4' 67"     | Dec. 25 | 38' 15"     | +7' 74"     |

This table gives the angular dimensions of the outer limit of Saturn's outer Ring as seen from the Earth. The + sign shows that the North side of the Ring is presented to the Earth throughout the year.

### Time Signals by Wireless Telegraphy.

IF a stone is dropped on a still sheet of water, there will proceed from the point where it falls a wave which will travel away in a widening circle. The wave will gradually diminish as it goes farther away until at last no perceptible undulation will remain. If stones be dropped continuously at regular intervals, say of one second, waves will follow one another, with equal spaces between consecutive waves. This distance between the crests of the waves is the wave-length and depends on the rate at which the stones are dropped, combined with the rate at which the waves leave the centre of disturbance. The distance to which the wave

On May 5 and 6 the moon sets before 3A. but the diagram given is the same as for night of full-moon.

#### THE AURORA BOREALIS.

This phenomenon is more terrestrial than celestial, and this paragraph, with that which follows, would have been more suitably placed in a later section. It sometimes happens that an unusual luminosity is seen in the northern sky in the form of streamers, arches, and condensations, and it is desirable to record the varying phases and times of these features. Its chief manifestations recur at fairly regular intervals of about eleven years, and seem to be associated with magnetic disturbances and Sun-spots, which have similar periods. The aurora is sometimes regarded as showing the outer limit of our atmosphere, and its height has been determined. The general result is that the elevation of an aurora is between 50 and 200 miles. The great majority are about 60 miles high, and there are few above 200 miles. There is some suggestion that, with magnetic storms, the period of their appearance follows that of the Sun's synodic rotation (27¼ days). On March 22, 1920, there was a very extended group of spots at the middle of the Sun's disc, a magnetic storm, and splendid display of aurora during the night. A similar coincidence occurred in 1921 (May 14).

#### THE ZODIACAL LIGHT.

This is an appearance which is little understood, and therefore deserves the attention of observers. It shows as a band of faint light which stretches up splendidly from the Sun before sunrise in the autumn months and after sunset in March. It may be the manifestation of a widely scattered appendage of the Sun or a vast concourse of slightly reflective meteoric systems. It has been asserted that it is a mere atmospheric effect, but this is not consistent with some of the chief features of its appearance. That it has a celestial origin seems certain, but its true nature is not clearly distinguishable on the evidence before us.

travels before dying out depends on the violence of the disturbance.

Similarly, the transmitting instrument at a wireless station disturbs the ether, and the waves in the ether, resulting from the disturbance, travel in widening circles which become less marked as they go until no perceptible undulation remains. The sending station can set the distance which separates successive waves as it pleases by using apparatus which fixes the number of times per second at which the ether shall be disturbed. It cannot control the rate at which the waves travel from their source, which is the same as the speed of

light, 186,000 miles per second, but it can set the wave-length on which it shall transmit its signals to suit its own convenience, and the distance to which a wave travels before dying out being dependent on the amount of energy employed is also within the control of the sending station.

Though the circles of waves which emanate from the various sending stations all over the world overlap and intersect, which may appear to result in disastrous confusion, nevertheless each train of waves continues regardless of other trains and its wave-length remains unaltered. With a 400-metre wave-length the waves follow each other as rapidly as 750,000 a second, whilst

the crests of the waves from Annapolis (wave-length 17,000 m.) pass the aerial at a rate of considerably less than 20,000 a second. A receiving instrument can only operate if adapted to some particular set of circumstances, and must be attuned to the particular wave-length of the sending station that it is desired to receive.

\* It is perhaps necessary to say that this does not refer to the action of the sending key. From the sending station a continuous train of waves is sent out and actuates the receiving instrument at a distant station properly tuned, so long as the transmitting key at the sending station is held down. By manipulating that key the continuous train is broken up into short and long pieces (dots and dashes).

#### WIRELESS TIME-SIGNALS THROUGHOUT THE WORLD.

|                             | Wave Length. | G. O. T. of Signals (approximately). |          | Description of Signals *   |

| San Francisco .....         | 2,400        | 6 0                                  | 20 0     | Dots every second from 5h. 59m. on. to 5h. 59m. 49s., omitting second 29 and last 5 of each minute. Dash at 6h. 0m. on. (signal).                              |
| Arguello Point .....        | 1,512        | 20 0                                 | 0 0      |  |
| San Diego .....             | 2,400        | 20 0                                 | 0 0      |  |
| Balboa (Panama) .....       | 7,000        | 10 0                                 | 18 0     |  |
| Valparaiso .....            | 2,500        | 1 0                                  | 0 0      | Dots every second, 2h. 59m. on. to 2h. 0m. on., omitting second 29 and last 10 of each minute.   |

\* For more complete descriptions of these signals reference may be made to the Admiralty publication "List of Lights, Time-Signals, Wireless, &c." Part I.

\* When signals are sent twice in the day as indicated in the third column, or when the description applies to more than one place, the times in this column are to be read, *mutatis mutandis*.

† Signals A consist of (1) a series of dashes (—) from 20h. 42m. on. to about 20h. 42m. 59s. with a (.) at 20h. 42m. on. (Short Time signal). (2) and (3) similar series of (—) and (—) from 20h. 42m. on. and 20h. 42m. on. respectively, with dots for time signals at 20h. 42m. on. and 20h. 42m. on. The beginning of the dot (about 2 sec.) being the time.

† Signals B are in accordance with the resolution of the International Time Conference of 1925 and consist of a series of the letter Z (Morse — — —) from 2h. 59m. on. to 3h. 0m. on., followed by letter O (— — —) ending 2h. 59m. on. (preparatory signal), a series of the letter N (—) the dash being made at every tenth second of the minute 2h. 59m. on., followed by 5 sounding 2h. 59m. on. and a series of letter O (—) ending with O at 2h. 59m. on. The last two series are time signals, and the end of the third dash of the O gives the time.

In all other cases in above list when the signal is a Dash, the beginning gives the time.

# Meteorological Summary (British Isles), 1920-1921.

95

THE results in the table below are for London (Westminster, New and Kensington Palace)—barometer readings reduced to Mean Sea Level, from November 1920 to October 1921 inclusive.

THE shape of our Earth is that of an oblate spheroid, or a solid of revolution whose meridian sections are ellipses not differing much from circles, whilst the sections at right angles to these are circles. The length of the Polar axis, according to a recently accepted determination (Hayford) is 7,900.0 miles and the diameter of the Equatorial circle 7,926.7 miles. The suggestion has been made that the Equator is not an exact circle, but the supposed deviation from circularity was small, and the fact has not been proved. The mean density of the Earth is 5.5 times that of water. The Earth moves round the Sun in a plane which passes through the Sun's centre, or, to write with more precision, the centre of gravity of the Earth and Moon moves in this plane, and the Earth revolves round this centre not remaining precisely in the plane. The plane is called the plane of the Ecliptic. The Earth's Equator is inclined to this plane at an angle of  $23\frac{1}{2}^{\circ}$ , and because of this inclination the Sun in the Northern hemisphere is high in the sky in the Summer months and low in the Winter. It is this tilt which causes the seasons, because the high altitude of the Sun in Summer makes the days longer and the Sun's rays fall more directly at a place in the Northern hemisphere. The case is reversed for the Southern hemisphere. The dates when the Sun is in the line of intersection of the planes of the Equator and Ecliptic are called the Equinoxes, and on these dates day and night are of equal duration all over the globe. The Sun and Earth are surrounded on all sides by the stars, and because the Earth moves round the Sun, the Sun appears to change its position with respect to the stars during the year, and different sets of stars are seen in the sky at midnight in Summer and Winter. The average velocity of the Earth in its orbit is  $18\frac{1}{2}$  miles a second, and it moves more slowly in July than in January. It makes a complete rotation on its axis in about 23 hours 56 minutes of mean time. Because the Earth moves round the Sun in the same direction as it rotates on its axis, the length of a solar day is more than the length of a rotation by about four minutes (see p. 99). It has been shown almost conclusively in recent years that the axis of rotation is not a fixed line in the Earth, but that its extremity, or the North Pole of the Earth, moves in a rough spiral curve about the pole of figure at a distance of a few feet from it.

## THE TIDES.

The Tides of the Ocean are rightly attributed to the attractive influence of the Moon on the Oceans, modified by a similar influence of the Sun but of less amount because of the much greater distance of the attracting body. If the Earth were a globe uniformly covered with water it might be possible to account for the observed phenomena and predict them by simple mathematical consideration of these attractive influences, but these are very greatly modified by the land formations of our globe, and the prediction of the tides for any port depends mainly on the results of observation. A series of observed times and heights of the tide having been compiled and analysed, the analysis will show that the complete tidal movement can be represented by the combination of a series of periodic terms, and when these terms are each carried forward to some future date

their recombination gives the predicted tide. The mean level of the sea remains practically constant, but small changes have been detected which may be assigned to various causes. Taking the mean sea-level as datum, high water is at its highest (springs) at or near New and Full Moon, whilst low water falls an equal amount below at those times. At or near the time of the first and last quarters of the Moon (neaps) the high water rises only about half as much above the mean level as it does at springs, and the low water falls about half as little below it. These phenomena do not usually coincide exactly with the times of these phases of the Moon, but occur later, the interval being known as the *age* of the tide—thus, at London Bridge, the highest or spring tide occurs  $2\frac{1}{2}$  days after New or Full Moon, and the neap tide is similarly delayed. The difference of height of spring and neap tides is the most apparent of the periodic differences which make up the whole tidal variation. Besides this there are differences due to the varying distance of the Moon from the Earth, and when the Moon is at or near perigee at New or Full the tide is specially high. There is a slight difference in the heights of the spring tide at New and Full Moon, and also in the height of the neap tide at the respective quarters, but these and other small periodicities are not appreciably noticeable at some ports.

## TERRESTRIAL MAGNETISM.

A phenomenon of the Earth, the origin of which is obscure, but on which some light has been thrown by recent investigations, is known as Earth magnetism. Its best known manifestation is its effect on the needle of a mariner's compass, which, except for the variations to be immediately described, points continually northward. The north point indicated by a compass needle is not, except in particular cases, the north point shown by astronomical observations; in other words, the needle does not point to the North Pole of the axis of rotation of the Earth, but makes an angle with the terrestrial meridian. This angle is called the Magnetic Variation, or, more generally, Magnetic Declination, and differs in different parts of the world and even over limited tracts of country. Along a line from the north of Norfolk through Greenwich to Chichester the declination is the same as at Greenwich. Along a parallel line through Dover the West declination is at present about a degree less; from Newcastle to Plymouth it is about  $1\frac{1}{2}^{\circ}$  greater; whilst at Dublin the declination West is  $3^{\circ}$  or  $4^{\circ}$  greater than at Greenwich. Observations of magnetic declination are made and charted to show the amount of this magnetic element over our globe, and from such charts it appears that there are two points or regions which may be considered as directive centres, and are known as the Magnetic Poles. At these places a freely suspended magnetised needle would stand vertically. They do not coincide with the terrestrial Poles, nor are they exactly antipodal. The position of the North Magnetic Pole is about latitude  $73^{\circ}$ , longitude  $100^{\circ}$  W.; the South is in latitude  $70^{\circ}$ , longitude  $150^{\circ}$  E., but these positions apparently undergo secular change. The magnetic declination at any place changes gradually year by year, and its amount observed in or near London at certain epochs is given in the table on p. 98. That the compass needle does not in general point true north and south,

but that it is inclined a certain amount east or west, and that the amount varies with the locality was recognised among western nations by the end of the 15th century, Columbus being credited with the discovery. That there is a secular change in the magnetic declination, or that the amount at any place changes slowly year by year, was discovered by Gellibrand in 1634.

#### Magnetic Declination at London.

| Year.      |             |
|------------|-------------|
| 1580 ..... | 11 15 East. |
| 1665 ..... | 1 30 West.  |
| 1765 ..... | 20 0 West.  |
| 1800 ..... | 24 0 West.  |

In 1859 the westerly declination at (Greenwich was about  $24^{\circ} 25'$ , which was probably its maximum. Since then it has been moving slowly eastward. The following table of mean magnetic elements is derived from the observations made at Greenwich in the respective years, and applies to Greenwich only. The figures for 1901 are approximate.

| Year. | Mean Magnetic Declination at (Greenwich West. | Horizontal Magnetic Force in G. (4 H. Units at Greenwich | Mean Inclination or Dip of Needle at Greenwich. |
|-------|---|--|---|
| 1900  | 0 59'0  | 2846   | 67 8'5  |
| 1910  | 15 41'2                                       | 2855   | 66 52'6   |
| 1916  | 14 46'9                                       | 28494  | 66 52'7   |
| 1917  | 14 37'0                                       | 28477  | 66 52'0   |
| 1918  | 14 37'0                                       | 28468  | 66 52'3   |
| 1919  | 14 18'2                                       | 28455  | 66 53'2   |
| 1920  | 14 8'7  | 28455  | 66 53'0   |
| 1921  | 13 59'0                                       | 2846   | 66 53   |

The dip is the angle that a delicately poised needle constrained to move in a vertical plane under the action of magnetism only will make with the horizontal plane.

The declination varies during the 24 hours, for the needle makes a small excursion in the morning from East to West, and returns, the range at Greenwich being about  $2\frac{1}{2}'$  in summer and  $7'$  in winter. The needle occupies its mean position in the morning about 10h., and again about 12h., throughout the year. It reaches its most westerly position about 24h., and its most easterly position during the night or early morning according to season of the year. The inclination or dip also varies in a similar manner to the declination. Since these variations of the magnetic elements are mainly confined to the hours of daylight, are much greater in summer than in winter, and are evidently affected by changes in the solar activity—for the variation is larger at times of Sun-spot maximum than at minimum—it may be concluded that they are in some way dependent on solar radiation, and it is suggested that the ionisation of the upper atmosphere by the Sun, which causes it to be highly conducting, may produce the effect.

#### MAGNETIC STORMS.

Besides these diurnal movements and their periodic variations, the magnets recording the three elements sometimes make sudden and violent oscillations which may continue for several hours. Such an occurrence is known as a Magnetic Storm, and is accompanied by spontaneous electric earth-currents, which, if unusually violent, cause hindrance to the working of cable and telegraph systems. These storms

begin suddenly, and practically simultaneously all over the Earth. There was a magnetic storm of great violence and of long duration in May, 1901, at a time when a group of spots was to be seen on the Sun. There are many examples that show storms and spots to be contemporaneous, and there is a theory not finally accepted that magnetic storms are caused by the direct action of electrified particles which are driven into space by solar action. Dates of previous magnetic storms of some violence are: Nov. 17, 1882; Feb. 13-14, 1892; Oct. 31, 1903; Sept. 25, 1909; August 9, 10, 1917; August 11, 1919 (with no accompanying spot); and March 22, 1920.

#### GRAVITY.

The law of attraction or universal gravitation affirms that two bodies exert on one another an attraction directly proportional to their masses and in inverse ratio to the square of the distance between them, and since this is so the terrestrial mass exerts an attraction upon all the bodies at its surface. The combination of this attraction with the (so-called) centrifugal force due to the rotation of the earth produces a resultant force which is known as gravity. The direction of this force is the vertical.

It is found by experiment that the force of gravity (generally indicated by the letter  $g$ ) is different in different latitudes. At the Pole the force exceeds that at the Equator by rather more than a two-hundredth part, or, in other words, a person who weighs 200 lbs. at the Equator by a spring balance would weigh by the same balance 201 lbs. at the Pole.

The experiments consist in finding the time of oscillation of the same pendulum in different latitudes, the time being smaller as  $g$  is larger. A pendulum which makes a swing in exactly one second is longer at places where  $g$  is large.

The following table gives the relative values of the force of gravity and the length of the seconds pendulum at various places— $g$  is the acceleration due to gravity in centimetres-per-second,  $l$  is given in centimetres.

|                             | $g$ .  | $l$ .  |
|-----------------------------|--------|--------|
| Equator .....               | 978.05 | 99.097 |
| Latitude $45^{\circ}$ ..... | 980.63 | 99.359 |

#### EARTHQUAKES.\*

Earthquakes, or earth tremors, are believed to be due to some form of fracture caused by the breakage of the Earth's substance under a growing strain, when the strain has passed the breaking point. This gives rise to waves which are propagated through the solid substance to distant parts of the Earth, and vertically upwards to the surface, sometimes with disastrous effects. The point where the fracture occurs and the earthquake originates is called the seismic centre, or origin, or focus. That part of the Earth which is vertically above this centre is called the epicentre. The waves transmitted through the Earth may come to the surface hundreds, or even thousands, of miles from the epicentre, and the times of arrival are recorded. The first indications on the seismograph are made by longitudinal waves (P), which are followed after an interval by direct transverse waves (S) in approximately the same path. From the length of the interval between the appearance of the (P) and the (S) waves, the distance of the origin is inferred.

*Greenwich Mean Time.*

Time, in the abstract, is measured by the distance described by a moving body, or machine, when the velocity of the same is sustained with perfect uniformity. Our rotating Earth is the moving body used to measure time, and a solar day is the duration of a complete rotation of the Earth round its axis with respect to the Sun, which is rather longer than a rotation with respect to the stars because the Earth moves round the Sun in the same direction as it rotates on its axis. The speed of the Earth's rotation is itself uniform, but the length of the solar day is affected, first by the movement of the Earth in its orbit round the Sun, which is not always at the same rate because of the ellipticity of the orbit, and also by the circumstance that the axis about which the Earth rotates is not perpendicular to the plane of that orbit. Clocks are adjusted to an average or mean solar day which is of uniform length and is divided into 24 equal hours. This is the basis of Mean Solar Time.

A unit and method of measurement having been established, it is necessary to choose a zero. The zero adopted is the instant when a fictitious body known as the Mean Sun, which is sometimes before, sometimes behind the real Sun in its apparent diurnal journey round the Earth, is on some chosen meridian. The meridian chosen being that which passes through some particular place, the time is called the Local Mean Time of that place. Usually some standard meridian, such as that of Greenwich, is chosen, and the time of that meridian is used throughout a whole country, and hence the expression Greenwich Mean Solar Time, or, more usually, Greenwich Mean Time arises (see Zone Standard Time, p. 100).

*Apparent Solar Time.*

The time shown by a sundial is affected by the two causes mentioned, which make the length of a solar day not uniform. This is called Apparent Solar Time, and differs from Mean Solar Time by the Equation of Time which is given in the second column of page 2 for each month, and is to be used according to the precept in the heading.

*The Astronomical Day.*

For purposes of Astronomy the day begins at noon, and the hours following noon are numbered successively from 1 to 23. There is therefore no use of the letters A.M. and P.M. in astronomical tables, but January 1<sup>st</sup> d. 22<sup>h</sup>. is the equivalent of January 20<sup>th</sup> a.m. in ordinary parlance, and January 2<sup>nd</sup> d. 0<sup>h</sup>. in astronomy is recognised as being January 2<sup>nd</sup> d. 0<sup>h</sup>. p.m. of ordinary life. In its early years the calculations of the Nautical Almanac were made for Apparent Noon, or the moment when the True Sun is on the meridian of Greenwich, and this is still done in some special cases, but at present the abbreviation G.M.T. indicates the time of a day which begins at Mean Noon, except when otherwise stated.

The use of a day of 24 hours beginning at noon for astronomical purposes is of great antiquity, but proposals have frequently been made for the unification of the astronomical and civil day, and in 1929 the Lords of the Admiralty, after consultation with the Royal Astronomical Society, decided to take this step. They have directed that a day beginning at midnight should be substituted for the Astronomical Day

in the *Nautical Almanac*, beginning with the edition for 1932. A day of 24 consecutively numbered hours beginning at midnight has already been used in various publications, and was adopted last year (1931) for the first time in this *Almanac*. This is generally called Greenwich Civil Time, and is indicated by the letters G.C.T.

*Sidereal Time.*

A sidereal day is the duration of a complete rotation of the Earth round its axis with reference to the stars. This is of uniform length, and is divided, like the mean solar day, into 24 equal hours, which are shorter than a solar hour by about 9<sup>h</sup> 53 seconds of mean time. As the sidereal day is about 4 minutes shorter than the mean solar day (see page 79), it begins earlier day by day by about that amount. The instant of the beginning of the sidereal day in G.M.T. is given on p. 2 of each month. In actual observatory practice time is measured, and the standard clock is regulated, by this rotation of the Earth with respect to the stars, and Mean Solar Time is derived from Sidereal Time by computation (see below). The error and rate of the sidereal clock are found by observing the instant it shows when certain stars, known as Clock Stars, cross the meridian or are due south, and comparison of this with the known time of transit (star's R.A.) will give the error of the sidereal clock. Comparison of the mean solar clock with the sidereal clock will show the error of the former. The same result might be arrived at directly by observing the instant by the Mean Time clock when the star crosses the meridian.

Ex.—To find the Mean Time which corresponds to 22<sup>h</sup>. 57<sup>m</sup>. 53<sup>s</sup>. Sidereal Time on Aug. 15:

|  |               |
|--|---------------|
|  | H. M. S.      |
| Sidereal Time at Mean Noon on August 15 (from page 53) .....   | 12 5 53       |
| (Interval from Noon in Sid. Time Retardation for 22 <sup>h</sup> . is 19 <sup>m</sup> 66 <sup>s</sup> . (page 79) .. 33 <sup>m</sup> . .. 5 <sup>h</sup> 41 <sup>s</sup> . .. 27 <sup>s</sup> . .. 7 <sup>s</sup> .) | 2 33 27<br>25 |
| Corresponding Mean Time ...  | 2 33 2        |

*"Summer" Time.*

In the spring of 1926 the Government adopted as a war-measure the principle of a scheme proposed by Mr. William Willett about the year 1907 and an Act was passed, known as the Summer Time Act (1926), the first clause of which runs: "During the prescribed period in each year in which this Act is in force the time for general purposes in Great Britain shall be one hour in advance of Greenwich Mean Time." A committee appointed to consider the working of the Act in 1926 reported in its favour, and Summer Time has been used in the following periods in accordance with an Order in Council issued in each year:—

|       |  |   |
|-------|--|---|
| 1926. | May 21 <sup>st</sup> 22 <sup>h</sup> .   | to Oct. 1 <sup>st</sup> 22 <sup>h</sup> .   |
| 1927. | April 24 <sup>th</sup> 22 <sup>h</sup> . | to Sept. 17 <sup>th</sup> 22 <sup>h</sup> . |
| 1928. | Mar. 24 <sup>th</sup> 22 <sup>h</sup> .  | to Sept. 30 <sup>th</sup> 22 <sup>h</sup> . |
| 1929. | Mar. 30 <sup>th</sup> 22 <sup>h</sup> .  | to Sept. 29 <sup>th</sup> 22 <sup>h</sup> . |
| 1930. | Mar. 28 <sup>th</sup> 22 <sup>h</sup> .  | to Oct. 29 <sup>th</sup> 22 <sup>h</sup> .  |
| 1931. | April 2 <sup>nd</sup> 22 <sup>h</sup> .  | to Oct. 3 <sup>rd</sup> 22 <sup>h</sup> .   |

The hour being Greenwich Civil in each case. (In 1930 the ending of the period was postponed for four weeks in view of a possible "strike" in the coal-mining industry.)

IN the year 1880 it was enacted by statute that the word "time" when it occurred in any legal document relating to Great Britain, was to be interpreted, unless otherwise specifically stated, as the Mean Time of the Greenwich meridian. There are other examples of the adoption by nations of the time of their own capital as the Standard Time of the country, but since the year 1883 the system of Standard Time by Zones has been gradually accepted, and now nearly all the countries of the world use as Standard the Time of some meridian which differs from that of Greenwich by a multiple of 15°, and therefore differs from Greenwich Mean Solar Time by an integral number of hours, either fast or slow. In a few cases differences including a half hour have been adopted.

The countries in which Standard Time has been adopted according to this scheme are given in the accompanying table. In the large territories of the United States and Canada it has been found expedient to adopt five different standard times, the territories being divided into five by meridians, 7½° on either side of the five central meridians. This arrangement is not strictly adhered to, because towns and cities near the dividing lines adopt which of the two times is the more suitable to railway or local requirements. The same plan is followed in Brazil, which is divided into three zones, and in these the time, 3 hours, 4 hours, or 5 hours slow on Greenwich, is adopted as standard respectively.

| 8             | " S....British Columbia, California,<br>Nevada, Oregon, Washington.  |
| 9             | " S....Yukon, Alaska.  |
| 10            | " S....Low Archipelago, Marquesas, Aus-<br>tral and Society Is.  |
| 10½           | " S....Sandwich Is.  |

The time 2 hours fast on Greenwich is called East-European, that 1 hour fast is called Mid-European. The time appropriate to Eastern Canada, 4 hours slow on Greenwich, has been called alternatively Maritime, Inter-Colonial, and Atlantic Time. The standard times in use in the other four zones of the North American continent are called respectively Eastern, Central, Mountain, and Pacific Time.

It will be inferred from the above table that when it is noon at Greenwich on any day of the week, it will be midnight of that day in the Fiji Islands, but half-past one in the morning of that same day in the Sandwich Islands, so that the calendar and times as kept at the two places will differ by nearly a day, though they are separated by a comparatively short distance.

#### THE DATE OR CALENDAR LINE.

The line where the change of date occurs as adopted by the British Admiralty is a modification of the 180th meridian, and is drawn so as to include islands of any one group of the same side of the line, or for political reasons. The line is indicated by joining up the following eight points:—

- (1) Lat. 60° S., long. 180°.
- (2) " 51½° S., long. 180°.
- (3) " 45½° S., long. 174½° W.
- (4) " 15½° S., long. 174½° W.
- (5) " 5° S., long. 180°.
- (6) " 48° N., long. 180°.
- (7) " 54½° N., long. 170° E.
- (8) " 65° N., long. 169° E.

Then through the centre of Bering Strait to a point lat. 70° N., long. 180°.

\* It is proposed that the time of New Zealand shall be altered to 2½ hours fast on Greenwich.

## THE AGE OF THE EARTH.

VARIOUS estimates have been made of the Age of the Earth, which were formerly based on unscientific processes. The scientific investigations of geologists and ethnographical research showed the inaccuracy of computations, which gave the year 4004 B.C. for the "Creation of the World" (Ussher); 3760 B.C. (Jewish Chronology); 4773 B.C. (Julian Epoch); or 5508 B.C. (Era of Constantinople). From the assumption that the Sun's heat is sustained solely by contraction of its bulk Lord Kelvin deduced 20,000,000 years as the time during which it has existed, but this period is much too short to be accepted by geologists as the Age of the Earth. The discovery of radio-active substances brought a new factor into consideration, and it has been lately estimated that as the abode of life (Lord Rayleigh, *Brit. Assoc.*, 1902) a moderate multiple of 1,000,000,000 years is the possible and probable duration of the earth's crust.

## GEOLOGICAL PERIODS.

The periods of stratification of the Earth's crust are classified by geologists as shown below, each period having sub-divisions:—

- I. AZOIC ("Without Life"), containing no trace of life in any form. The duration of this period probably far exceeded that of all the remaining divisions together.
- II. Eozoic ("Dawn of Life"), characterized by the first appearance of animal life.
- III. PALÆOZOIC ("Old Life") or PRIMARY, containing traces of extinct animal life:—
  - i. Cambrian, exemplified in Wales (Cambria), Cumberland, etc.—the earliest group which possesses a connected suite of fossils.
  - ii. Ordovician, exemplified in North Wales and named after the ancient British tribe (Ordovices) inhabiting the region.
  - iii. Silurian, named after the ancient British inhabitants (Silures) of S.E. Wales.
  - iv. Devonian or Old Red Sandstone, from the prevalence of the system as a marine formation in Devonshire.
  - v. Carboniferous, including Coal Measures, Millstone Grit and Mountain Limestone.
  - vi. Permian, from the Russian province of Perm, where these strata are widespread.
- IV. MESOZOIC ("Middle Life") or SECONDARY, with intermediate forms of animal life:—
  - i. Triassic, from the three (tri-) divisions of the type formation in Germany.
  - ii. Jurassic, typically displayed in the Jura Mountains.
  - iii. Cretaceous, from the chalky nature of its representatives where first studied.
- V. CENOZOIC ("New Life") or TERTIARY, containing forms of existing life:—
  - i. Eocene, the dawn or beginning of new forms of life, i.e., existing species.
  - ii. Oligocene, containing a few still existing species.
  - iii. Miocene, containing a minority of existing species—less than 50 per cent.
  - iv. Pliocene, the fossil remains show a majority of still existing species.
- VI. QUATERNARY ("Fourth in Order") or POST-TERTIARY:—
  - i. Pleistocene or Glacial, the greatest number of the remains are those of still existing species. Period of last Great Ice Age.
  - ii. Recent or Post-Glacial.

Definite dates cannot be assigned to most

periods, but G. de Geer has shown that scarcely 9,000 years ago the site of Stockholm was beneath the ice-sheet (VI. I.). Traces of human life are first found in V. iv.

## THE ANTIQUITY OF MAN.

*Pithecanthropus erectus* (Erect Ape-man).—Remains of a skull and of a thigh bone were found in 1891 and 1892 by Professor Dubois, at Trinil, Java. These are held to be remains of a creature of Pliocene times (see Geological Period, ante), about midway between the Orangutan and Man in development.

*Homo Heidelbergensis* (The Heidelberg Man).—A lower jaw was discovered near Mauer, Heidelberg, in 1907. This is held to be that of a primitive man of the earliest Pliocene Period. The difficulty of assigning dates to the Heidelberg or Trinil remains is shown in the conflict of authority, as one estimate gives 140,000 years (Rutot) for the whole, and another gives 700,000 years (Sturge) for a portion only of the Pliocene Period.

*The Piltdown Skull*.—Discovered in 1912 at Piltdown, Sussex, and ascribed to primitive man (Eo-anthropos) of early Palæolithic times.

*Neanderthal Man*.—Remains of a skull and parts of a skeleton found in 1856 in the Neanderthal Ravine, near Dusseldorf, Rhenish Prussia, and others found at Spy, Belgium, in 1884, are held to represent the oldest known dolichocephalic (long-headed) race in Europe, living about 50,000 years before the Christian Era.

*Homo primigenius*.—Discoveries of interred human remains at Combe Capelle, Dordogne, France (1909), at Brühx and Brinn, Moravia, and at Galle Hill, Northfleet, Kent (1895) are held to be those of human beings of late Palæolithic times, from 35,000 to 15,000 B.C.

## STAGES OF CIVILIZATION.

The terms employed by ethnologists cover periods which reach to the more recent geological divisions of time and extend to the present day. They are periods, not of time, but of culture, and are of local application only, there being no universal synchronous sequence in all parts of the world. This may be better understood when it is remembered that while races of Europe, Asia and America had reached the Iron Age of development long before the 18th century, A.D., there were races in Oceania still in the Palæolithic (or at least Neolithic) stage at the time of Cook's voyages. Dates appended to the various stages are necessarily conjectural and they are based on parallel discoveries of remains of extinct or still existing animal life.

*The Stone Age*.—The ancestors of primitive man are held to have adopted the use of stones of a suitable size for defence against predatory mammals and for the slaughter of animals for food, while primitive man made such instruments more effective by sharpening them to a rough point. The earliest period is known as *Eolithic*, or Dawn of the Stone Age, and this period may have extended to 600,000 years B.C. Weapons of a later period, known as *Palæolithic*, or Old Stone Age, show gradual developments, from the chipped, leaf-shape forms, known as *Chellean* (from Chelles, Seine et Marne, France), and employed, perhaps, from 400,000 to 100,000 B.C., to later and more effective flint points, arrow-heads and spear-heads, flat on one side, known as *Mousterian* (from Le Moustier, where many such implements and other remains were found). The Mousterian period is held to have lasted until about 20,000 B.C., when *Neolithic*,

or New Stone Age, weapons, polished and less crudely fashioned, were brought into use for a further period of about 5,000 years. In the Stone Age the burial of the dead was influenced by the primitive nature of the implements available for digging, the graves being only large enough to contain a body huddled together in a cramped position.

**Cultivation of the Soil.**—Cultivation is believed to have followed the interment of the dead about 25,000 B.C., and rendered possible the political (*polis* = city) organisation of mankind. There appears to have been a definite centre of Western Civilization at *Nippur* (and elsewhere in Mesopotamia) no later than 6,000 B.C., and in *Egypt*, under the first of the Pharaohs (*Menes*), about 5,000 B.C. It is not yet known if a similar degree of Eastern civilization had been reached in China, or elsewhere, during (or before) that of Mesopotamia and Egypt.

**The Bronze Age.**—Intercommunication of races introduced a knowledge of the malleable properties of copper, while the spread of commerce distributed tin from Saxony and Cornwall among the races of Europe and Asia. Implements of cast bronze superseded the more primitive polished stone weapons, while utensils and ornaments of the same alloy replaced those of wood or horn or bone. The designs and decorations of the Bronze Age suggest that this stage of culture was introduced into Europe from Asia, and it must therefore be dated for the East far earlier than for the West, over a period ranging from 5,000 to 3,000 B.C. The Bronze Age appears to have been marked by the cremation of human remains, in place of mere burial in a constricted position.

**The Iron Age.**—Implements of cast bronze were in turn superseded by those of hammered iron at varying dates—in China, Chaldaea, Assyria and Egypt about 4000 B.C.; in South-Eastern Europe about 3000 B.C., spreading over the rest of Europe from 1000 B.C. to 500 A.D., by which time the use of hammered iron was known throughout Scandinavia and in Ireland. It is possible that the Eastern civilization discarded the use of bronze and adopted that of iron even before the West had reached the Bronze Age, and while the remoter parts were still in the Palaeolithic Age. With the Iron Age was re-introduced interment of human remains, in place of Bronze Age cremation, but the bodies were laid at full length in the ground and not huddled up as in the Stone Age. The later Iron Age has developed into the *Steel Age*, and the transition from iron to steel marks a stage in the progress of civilization at least as great as that from the Bronze to the Iron Age.

#### EPOCHS AND CALENDARS.

**Abyssinians.**—The Ethiopians have a chronological system which starts from the first day of the reign of the Roman Emperor Diocletian and proceeds in cycles of 532 years, commencing at 1 again upon the completion of each cycle. Their first year began on 29th August, 284 A.D. (See also "Coptic," post.)

**Armenians.**—The Armenians marked their secession from the Greek Church by adopting it as their epoch. This corresponds to 9th July, 552 A.D.

**Assyrian or Babylonian.**—In the eighth century B.C. the Babylonians commenced a chronology with the era of the founder of their Empire. Their epoch corresponds to 25th February, 747 B.C.

**Biblical.**—The Christians of Western Europe

made many calculations concerning the date of the Creation of the World, based upon the genealogical tables in the Old Testament. In the seventeenth century (1650) James Ussher, Archbishop of Armagh, published his *Annals Antiquæ Testamenti*, and Ussher's Notation was afterwards printed in marginal notes to the Authorised Version of the English Bible. Ussher's Notation placed the Creation of the World in 4004 B.C.

**Christian.**—The Christian year was first adopted in Italy in the sixth and was accepted by England in the eighth century. The years are distinguished by cardinal numbers before or after the Incarnation, the period being denoted by the letters B.C. (Before Christ) or, more rarely, A.C. (*Ante Christum*) and A.D. (*Anno Domini*), the conventional abbreviation A.D. signifying *Anno Domini*, "In the year of the Lord." The correlative dates of the epoch are the 4th year of the 124th Olympiad, the 753rd year from the Foundation of Rome, 2760 A.M. (Jewish Chronology), and the 4714th year of the Julian Period. The date of the Nativity of Christ does not in fact correspond with 1 A.D., but is placed in an earlier year from B.C. 4 to B.C. 9. A "Christian Era Calendar," giving the days of the week of any year in the Christian Era, was given on pp. 98-9 of the 1921 issue.

**Coptic.**—In the Coptic Calendar, which is used by part of the population of Egypt and Ethiopia, the year is made up of 12 months of 30 days each, followed, in general, by 5 complementary days. Every fourth year is an intercalary or Leap-year, and in these years there are 6 complementary days. The intercalary year of the Coptic Calendar immediately precedes the Leap-year of the Julian Calendar. The Era is that of Diocletian or the Martyrs, the origin of which is fixed at A.D. 284, August 29 (Julian date). A Coptic Calendar for the year 1638 and part of 1639 is appended:—

| Year 1638.     | A.D. 1921. | Year 1638.  | A.D. 1922. |
|----------------|------------|-------------|------------|
| Tut .....      | Sept. 11   | Bahab ..... | June 8     |
| Bahab .....    | Oct. 11    | Abib .....  | July 8     |
| Hatur .....    | Nov. 10    | Maeri ..... | August 7   |
| Kihak .....    | Dec. 10    | Complement- |            |
|                | A.D. 1922. | ary days .. | Sept. 6-20 |
| Tubah .....    | Jan. 9     | Year 1639.  |            |
| Amshir .....   | Feb. 8     | Tut .....   | Sept. 11   |
| Barmahat ..... | March 10   | Bahab ..... | Oct. 11    |
| Barmudah ..... | April 9    | Hatur ..... | Nov. 10    |
| Bashuns .....  | May 9      | Kihak ..... | Dec. 10    |

**Hindu.**—In addition to the Muhammadan reckoning there are four eras used in India. The principal astronomical system was the *Kaliyuga Era*, which appears to have been adopted in the fourth century A.D. It began on 18 February, 3102 B.C. The chronological system of Northern India, known as the *Vikrama Samvat Era*, prevalent in Western India, began on 23 February, 57 B.C. The year 1922 A.D. is, therefore, the year 1979 of the Vikrama Era. In Southern India, the *Saka Era*, with its epoch of 3 March, A.D. 78, was probably founded by Kanishka (whose sway was widely extended), and is in general use. The year 1922 A.D. is 1844 of the Saka Era. In the Hills, the *Saptarshi Era* dates from the moment when the Saptarshi, or sages, were translated and became the stars of the Great Bear in 3096 B.C.

There are many obsolete eras in the history of the Indian Peninsula. The principal religious systems of chronology were those of the Buddhists and the Jains. The Buddhists reckoned

from the death of Buddha in 543 B.C. (the actual date being 477 B.C.); and the epoch of the *Jains* was the death of Vardhamana, the founder of their faith, in 527 B.C.

*Japanese and Chinese.*—Japan in 1872 and the Chinese Republic in 1912 adopted the calendar of Western Europe.

*Jewish.*—In the fifteenth century the Jews adopted as their epoch the Creation of the World, which was placed in a year called in the Christian chronology 3760 B.C. Thus the year 1922 A.D. is *Annuus Mundi* 5682-3 in the Jewish Calendar. A calendar for 5682-5683 is appended:—

(A.M. 5682 and part of A.M. 5683.)

| A.M. 5682.   | A.D. 1922.                             |

| " 25         | Hanuca, Dedication of the Temple. Dec. 15 |
| Tebet 1      | New Moon " 20                             |
| " 10         | Fast of Tebet " 29                        |

*Note.*—All Jewish Sabbaths and Festivals begin the previous evening at Sunset.

*Macedonian.*—The epoch was the occupation of Babylon by Seleucus Nicator in 321 B.C., and this system of chronology prevailed in all Greek countries until the Middle Ages, and was adopted

by the Jews until the fifteenth century. It is extant among certain nomadic Arab tribes.

*Muhammadian.*—The Muhammadian Epoch is the Hijra (Flight of Muhammad) from Mecca to Medina in 622 A.D. The first day of the first month of the Muhammadian Era corresponds to 16th July, 622 A.D. The year 1922 is therefore 1340-1 of the Hijra, a calendar for which year is appended:—

| Year of Hijra | A.D. 1922.   |
|---------------|--------------|
| 1340          |              |
| Muharram      | September 4  |
| Saphar        | October 4    |
| Rabla I       | November 2   |
| Rabla II      | December 2   |
| Jomada I      | December 31  |
|               | A.D. 1922.   |
| Jomada II     | January 30   |
| Rajab         | February 28  |
| Shaaban       | March 30     |
| Ramadan       | April 28     |
| Shawail       | May 28       |
| Dulkaada      | June 26      |
| Dulheggia     | July 26      |
| 1341          |              |
| Muharram      | August 24    |
| Saphar        | September 23 |
| Rabla I       | October 22   |
| Rabla II      | November 21  |
| Jomada I      | December 20  |

*Olympiads.*—Greek chronology was reckoned in cycles of four years corresponding with the periodic Olympic Games held on the plain of Olympia, in Elis, once in four years; the intervening years being the first, second, &c., of the Olympiad, which received the name of the victor at the Games. The first recorded Olympiad is that of Choroebus, 776 B.C.

*Persian.*—The chronology of Persia, which is still followed by the Parsees of India, dates from the accession of Yazdegerd III. to the throne on 10th June, 632 A.D. The year 1922 is, therefore, 1291 of the Parsees. The New Year begins on 21st March.

*Roman.*—Roman historians adopted as an epoch the Foundation of Rome, which they signified by the abbreviation A.U.C., *Ab (anno) Urbis Condite* (From the year of the founded city). This epoch is believed to fall in the year 753 B.C. The Calendar as we know it was a Roman institution; it was revised and reformed in 46 B.C. by Julius Caesar, who added months named "Julius" and "Augustus" before the former seventh month, and thus caused *Septem- Octo-, Novem- and December* to become the 6th, 10th, 11th and 12th months. It remained unchanged in the British Dominions until the year 1752 A.D. (See "Old and New Style," post.) In the Roman (Julian) Calendar the days of the month were not counted onward from the beginning, as with us, but three fixed points were taken, and the intervening days were said to be so many days *before* the next coming fixed day. These three points were (1) the Kalends, by which name the first of each month was known; (2) the Nones, which fell on the seventh day of the month in March, May, July, and October, and on the fifth day in each of the other months; and (3) the Ides, which always fell eight days after the Nones. After the Ides the days were reckoned as being so many "before the Kalends of the next month" or *ante-diem-Kalendas*, the last day being called the day before the Kalends of the next month, thus Dec. 31 would have been *Pridie Kalendas Januariæ*.

## CHRONOLOGICAL TERMS.

**The Day, Week and Month.**—Measurements of time are based on the time taken by the earth to rotate on its axis; by the moon to revolve round the earth; and by the earth to revolve round the sun. As these motions are not exactly commensurable with one another, it has been necessary to adopt average or mean intervals of time for ordinary use. Of these the first is the *Day*, which commences at midnight and is divided into 24 hours of 60 minutes, each of 60 seconds. The hours are counted from midnight up to 12 at noon, and again from noon up to 12 at midnight, except when the *Twenty-four Hour* reckoning is employed. The 24-hour reckoning ignores A.M. and P.M., and the hours are called 1 to 24 from midnight to midnight.

For the *Astronomical Day* see p. 99.

With the *Jews* and *Muhammadans* the day begins, not at midnight, but at sunset on the previous day, and the hours between sunset and midnight belong to the *succeeding* day in the Jewish and Muhammadan calendars.

**The Week** is a period of 7 days.

**The Month** in the ordinary calendar is approximately the twelfth part of a year, but the length of the different months varies as follows:—

January, March, May, July, August, October, and December have each 31 days.

April, June, September, and November have each 30 days.

February has 28 days, except in leap year, when it has 29 days.

The *Jews* and *Muhammadans* use the *Lunar Month*, based on the length of time that the moon takes to revolve round the earth. The month commences, not at true new moon, but at sunset of the day when the new moon is first seen after sunset. The length of the lunar month varies, and the Jewish and Muhammadan months have sometimes 30 and sometimes 29 days.

**The Equinoctial or Tropical Year** is the time that the earth takes to revolve round the sun from equinox to equinox, which is 365.2422 mean days. The *Calendar Year* consists of 365 days, but every year the date of which is divisible by 4, without remainder, is *Leap Year* and consists of 366 days, except the last year of each century that is not divisible by 400 without remainder (e.g. the years 1800 and 1900 had only 365 days). The extra day in every fourth year was added by Julius Caesar in order to reconcile the Tropical and Calendar years, and four Julian years thus contained 1461 days. There was therefore an error amounting to 3.12 days in 400 years, which was partly remedied by the omission of 3 days in every 400 years under the reform of 1582 (see "Old and New Style" post).

The *Muhammadan year* always consists of twelve lunar months, and is sometimes 354 and sometimes 355 days in length.

**Old and New Style.**—Towards the close of the 16th century there was a difference of 10 days between the tropical and calendar years (see above). In 1582 Pope Gregory ordained that Oct. 5th should be called Oct. 15th, and that only every fourth (instead of every) end-century year should be a leap year. This change was adopted by Italy, France, Spain, and Portugal in 1582; by Russia, the German Roman Catholic States, Switzerland, Holland, and Flanders on Jan. 1, 1700; Poland 1766, Hungary

1807, the German and Netherland Protestant States and Denmark 1700, Sweden (gradually) by the omission of eleven leap days, 1700–1740, the British Dominions (which included the then North American Colonies) in 1752, by the omission of eleven days (Sept. 3 being reckoned as Sept. 14). This "Western" Calendar was adopted by Japan in 1872, China in 1912, Bulgaria in 1915, Soviet Russia in 1917, and by Yugo-Slavia and Rumania in 1919. The difference between the Old and New Styles since 1900 is 13 days (11 days after 1700, 12 days after 1800 and 13 days after 1900).

**New Year's Day.**—The Civil year in the British Dominions (exclusive of Scotland) commenced with March 25, "Lady Day" or "The Feast of the Annunciation," until 1752. But on and from 1752 the civil year has commenced with Jan. 1. The Old Style reckoning is still maintained to some extent by the British Treasury, and certain dividends are payable at the Bank of England on the Old Style Quarter Days, while the "Financial Year" is still reckoned as commencing on "Old Lady Day," April 5. Scotland in 1600 changed New Year's Day from Mar. 25 to Jan. 1. On the Continent, Jan. 1 was adopted as the first day of the year by Venice in 1522, Germany in 1544, Spain, Portugal and the Roman Catholic Netherlands in 1556, Prussia, Denmark and Sweden in 1559, France 1564, Lorraine 1579, Protestant Netherlands 1583, Russia 1745, Tuscany 1751.

**Golden Number**, so called from its importance in calculating the date of Easter, is the number of any year in a lunar cycle of nineteen years. It contains (approximately) 235 lunations, in which period the Moon returns to the same apparent position with regard to the Sun, so that new and full Moons occur at the same dates in the corresponding year of each cycle.

**Easter Day** is the first Sunday after the *Paschal Full Moon* (i.e., the full moon which happens upon, or next after, March 21; if that full moon occurs on a Sunday, Easter Day is the Sunday after). A Table of Easter Days from 1761 to 2000 A.D. will be found on p. 77. A bill was introduced in Parliament in 1921 to regulate the date of Easter, and under this regulation Easter Day would fall each year on the second Sunday in April.

**Epart.**—The age of the Moon at the commencement of the year, thus indicating the difference between the solar and lunar cycles.

**Solar Cycle.**—A period of twenty-eight years, in any corresponding year of which the days of the week recur on the same days of the month.

**Julian Period.**—"A period of 7980 Julian years, proposed by Joseph Scaliger in 1582 as a universal standard of comparison of chronology, consisting of the product of the number of years in the solar and lunar cycles and the cycle of the indiction (28 × 19 × 15)." — *New English Dictionary*.

**Roman Indiction.**—A period of fifteen years, instituted by the Emperor Constantine in A.D. 313 for fiscal purposes.

**The Dominical Letter** is one of the first seven letters of the alphabet, A–G, which are used in succession to denote the Sundays (Lord's Day) in a particular year. If the first day of the year is a Sunday the letter is A; if the second, B; the third, C; and so on. Leap year requires two letters, the first for Jan. 1–Feb. 29, the second from March 1–Dec. 31. A Table of Dominical Letters from 1761 to 2000 A.D. will be found on p. 77.

**CHRONOLOGICAL LANDMARKS.**

| B.C.   | A.D.  |
|--------|---|
| 10,000 | 17 Death of Livy.                               |

| 500    | 430 Anglo-Saxon raids into Britain.             |
| 490    | 432 St. Patrick landed in Ireland.              |
| 488    | 439 Carthage captured by Vandals.               |
| 487    | 451 Attila defeated by Aetius.                  |
| 480    | 455 Rome sacked by the Vandals.                 |
| 479    | 493 Theodoric (Ostrogoth) became King of Italy. |
| 456    | 500 Welch defeated Saxons at Mt. Badon.         |
| 447    | 544 Scythian invasion of India.                 |
| 431    | 553 Italy reconquered by Justinian.             |
| 431    | 565 North Italy conquered by Lombards.          |
| 429    | 570 Birth of Muhammad.                          |
| 424    | 577 Saxons defeated Welch at Deorham.           |
| 415    | 596 St. Augustine landed in England.            |
| 406    | 613 Anglo-Saxons defeated Welch at Chester.     |
| 406    | 616 Persian conquest of Egypt.                  |
| 404    | 622 The Hijra, or Flight of Muhammad.           |
| 401    | 634 Syria conquered by Omar.                    |
| 401    | 638 Jerusalem occupied by Omar.                 |
| 399    | 640 Alexandrian Library destroyed.              |
| 390    | 643 Othman became Caliph.                       |
| 380    | 650 Saracen conquest of North Africa.           |
| 377    | 693 The Laws of Ine promulgated.                |
| 357    | 711 Saracens invaded Spain from Africa.         |
| 347    | 732 Charles Martel defeated Saracens.           |
| 334    | 738 Death of Bede, Anglo-Saxon chronicler.      |
| 326    | 741 Death of Charles Martel.                    |
| 323    | 778 Offa's Dyke built, Dee to Wye.              |
| 323    | 800 Charlemagne became Emperor of the West.     |
| 323    | 802 Egbert became King of Wessex.               |
| 323    | 866 Danish invasions of England.                |
| 321    | 878 Alfred's treaty with Guthrum the Dane.      |
| 321    | 912 Rolf the Northman invaded France.           |
| 320    | 935 Algiers founded by Muhammadan Arabs.        |
| 319    | 962 Otto I. of Germany Western Emperor.         |
| 312    | 969 Cairo founded by the Saracens.              |
| 312    | 982 Renewal of Danish invasions.                |
| 310    | 991 First payment of Gafol (Danegeld).          |
| 310    | 1000 Viking voyages to North America.           |
| 310    | 1000 Norway conquered by Danes.                 |
| 310    | 1011 Canterbury sacked by Danes.                |
| 310    | 1014 Scandinavians defeated at Clontarf.        |
| 310    | 1018 Lothians conquered by Scots.               |
| 310    | 1057 King Duncan murdered by Macbeth.           |
| 310    | 1065 Westminster Abbey dedicated.               |
| 310    | 1066 The Norman Conquest of England.            |
| 310    | 1086 Domesday Book completed.                   |
| 310    | 1099 The First Crusade.                         |
| 310    | 1099 Godfrey de Bouillon captured Jerusalem.    |

- 1147 The Second Crusade.  
 1169 Saladin became Sultan of Egypt.  
 1172 Henry II. landed in Ireland.  
 1187 Saladin captured Jerusalem.  
 1189 The Third Crusade.  
 1190 Death of Frederick Barbarossa.  
 1200 The Fourth Crusade.  
 1204 Capture of Constantinople by Latins.  
 1206 Muhammadan State founded at Delhi.  
 1210 The Fifth (Children's) Crusade.  
 1214 Peking captured by Jenghiz Khan.  
 1215 Magna Carta signed at Runnimead.  
 1219 Mongol invasion of India.  
 1228 Sixth Crusade and capture of Jerusalem.  
 1240 Mongolian conquest of Russia.  
 1244 Jerusalem captured by Mongols.  
 1249 Oxford University founded.  
 1250 Mameluke conquest of Egypt.  
 1258 Baghdad destroyed by Hulagu Khan.  
 1261 Constantinople recaptured by Greeks.  
 1265 First representative Parliament in England.

THE *Superficial Area* of the Earth is estimated to be 196,550,000 square miles, of which 55,500,000 square miles are Land and 141,050,000 square miles Water. The *Diameter* of the Earth at the *Equator* is 7,926½ English miles, and at the *Poles* 7,900 English miles. The *Equatorial Circumference* is 24,901·8 English miles, divided into 360 Degrees of Longitude, each of 69·17 English (or 60 Geographical) miles; these Degrees are measured from the Meridian of Greenwich, and numbered East and West of that point to meet in the Antipodes at the 180th Degree. Distance North and South of the Equator is marked by *Parallels of Latitude*, which proceed from zero (at the Equator) to 90° at the Poles.

## AREA AND POPULATION.

| Continent.        | Area in Square Miles. | Estimated Population. |
|-------------------|-----------------------|-----------------------|
| Europe .....      | 3,750,000             | 400,000,000           |
| Asia .....        | 17,000,000            | 910,000,000           |
| Africa .....      | 11,500,000            | 180,000,000           |
| North America ..  | 8,000,000             | 120,000,000           |
| South America ..  | 6,800,000             | 38,000,000            |
| Oceania .....     | 3,450,000             | 3,000,000             |
| Polar Regions ... | 5,000,000             | ...                   |
|                   | 55,500,000            | 1,645,000,000         |

The British Empire extends over the largest area (14,220,000 sq. miles); Russia is the second largest country (8,400,000 sq. miles); France is third, with 4,336,000 sq. miles; China extends over 4,300,000 sq. miles; the United States, with its Insular Jurisdiction, &c., covers 3,750,000 sq. miles, and Brazil 3,220,000 sq. miles.

## THE RACES OF MANKIND.†

The Races of Mankind are divisible according to Stock or, less scientifically, according to Colour. The Dominant Colour is Yellow—the numerical order being (1) Yellow, (2) White, (3) Black, (4) Brown, (5) Red. The main Divisions of the Races are as follows:—

| Division.      | Area.              | Estimated Number |
|----------------|--------------------|------------------|
| Mongolian ..   | Asia .....         | 655,000,000      |
| Caucasian ...  | Europe & Orient .. | 645,000,000      |
| Negro .....    | Africa .....       | 190,000,000      |
| Semite .....   | North Africa ..... | 81,000,000       |
| Malayan .....  | Australasia .....  | 52,000,000       |
| Red Indian ... | America .....      | 23,000,000       |
|                |                    | 1,645,000,000    |

\* The Earth is a Sphere, with a Northern and Southern Hemisphere; the Ocean surface is called the *Hydrosphere*, and the gaseous envelope the *Atmosphere*. The science concerned with the study of the Earth's crust is *Geology*, with the measurement of its surface *Geodesy*; the study of its surface is *Geography*, and of its superficial features *Physiography*. The study of the hydrosphere is *Oceanography*, of the lakes *Limnology*, and of the mountains *Ornography*. The study of the Races of Mankind is *Ethnology*, and of their location *Ethnogeography*. The study of extinct organic life is *Paleontology*, and of existing life *Biology*.

† An airplane with a constant speed of 100 miles an hour would take nearly 22 years to reach the Sun. The velocity of a given point of the Earth's surface at the Equator exceeds 1,200 miles an hour (46,408 miles in 24 hours); the Earth's velocity in its orbit round the Sun is about 68,000 miles an hour (54,000,000 miles in 24 days, 6 hours, 2 minutes).

† It has been estimated that the Earth can maintain a population of 4,000,000,000, a total which will be reached about A.D. 2222, at the present rate of increase.

### OCEAN AREAS AND DEPTHS.

The greatest known Ocean Depth (in the Pacific, off Mindanao, 32,089 feet) is not much greater than the greatest land height (in the Himalayas); but the mean depth of the Ocean floor exceeds 12,000 feet, while the mean height of the surface of the land area of the Earth above sea level is only 2,300 feet. The following table gives the areas of the principal oceans and seas, with the greatest known depth of each:—

| Name.                  | Area of Basin (sq. miles). | Greatest Depth (feet).    |
|------------------------|----------------------------|---------------------------|
| Pacific .....          | 63,986,000                 | Off Mindanao, 32,089      |
| Atlantic .....         | 31,530,000                 | Porto Rico Trench, 31,366 |
| Indian .....           | 28,350,000                 | Sunda Trench, 22,968      |
| Arctic .....           | 5,541,600                  | North Polar, 13,300       |
| Malay .....            | 3,137,000                  | Kel Trench, 21,342        |
| Central American ..... | 1,770,170                  | Caribbean, 20,568         |
| Mediterranean .....    | 1,145,000                  | Pola Deep, 12,276         |

| Ruwenzori .....           | Uganda           | 16,800          |
| Kasbek .....              | Caucasus         | 16,546          |
| Mont Blanc .....          | Alps             | 15,781          |

\* Volcanoes. In addition to those marked, Vesuvius, St. and Stromboli in Europe, Erebus and Terror in the Antarctic, Meadand Skaptar Jökull in Iceland, Mauna-Loa, Kea and Hualalai in Hawaii, Tombora in Japan, and Le Souffrier and La Pelée in the West Indies.

### THE LARGEST ISLANDS.

| Name of Island.                 | Ocean.   | Area in Sq. Miles. |
|---------------------------------|----------|--------------------|
| Greenland (Danish) .....        | Arctic   | 877,300            |
| New Guinea (Brit.-Neth.) .....  | Pacific  | 330,000            |
| Borneo (Brit.-Netherlands) ..   | "        | 280,000            |
| Baia Land (British) .....       | Arctic   | 136,000            |
| Madagascar (French) .....       | Indian   | 228,000            |
| Sumatra (Netherlands) .....     | "        | 160,000            |
| Great Britain .....             | Atlantic | 88,603             |
| Honshiu (Japan) .....           | Pacific  | 87,500             |
| Celebes (Netherlands) .....     | Indian   | 72,000             |
| Prince Albert, &c. (British) .. | Arctic   | 60,000             |
| South Island, N.Z. (British) .. | Pacific  | 58,500             |
| Java (Netherlands) .....        | Indian   | 48,400             |
| North Island, N.Z. (British) .. | Pacific  | 44,500             |
| Cuba (Independent) .....        | Atlantic | 44,000             |
| Luzon (U.S.A.) .....            | Pacific  | 41,000             |
| Newfoundland (British) .....    | Atlantic | 40,200             |
| Iceland (Danish) .....          | "        | 40,000             |
| Ellesmere (British) .....       | Arctic   | 40,000             |
| Mindanao (U.S.A.) .....         | Pacific  | 37,000             |
| Hokkaido (Japan) .....          | "        | 36,500             |
| Ireland (U.K.) .....            | Atlantic | 32,600             |
| Novaya Zemlya (Russian) .....   | Arctic   | 30,000             |
| Sakhalin (Russo-Japanese) ..    | Pacific  | 29,100             |
| Haiti (Independent) .....       | Atlantic | 28,300             |
| Tasmania (British) .....        | Pacific  | 26,215             |
| Ceylon (British) .....          | Indian   | 25,400             |
| Banka (British) .....           | Arctic   | 25,000             |
| North Devon (British) .....     | "        | 24,000             |
| Vancouver (British) .....       | Pacific  | 20,000             |
| Melville Land (British) .....   | Arctic   | 20,000             |
| Tierra del Fuego (Argentine) .. | Atlantic | 18,500             |
| Southampton (British) .....     | Arctic   | 17,800             |
| West Spitzbergen (Norway) ..    | "        | 15,260             |
| Prince of Wales (British) ..... | "        | 15,000             |
| Formosa (Japanese) .....        | Pacific  | 13,500             |
| North Somerset (British) .....  | Arctic   | 12,000             |
| Sicily (Italian) .....          | Medit.   | 10,000             |

### THE LONGEST RIVERS.†

| River.              | Outflow.             | Length in Miles. |
|---------------------|----------------------|------------------|
| Amazon .....        | Atlantic             | 4,900            |
| Nile .....          | Mediterranean        | 3,600            |
| Yangtse .....       | North Pacific        | 3,400            |
| Yenisei .....       | Arctic Sea           | 3,300            |
| Mississippi .....   | Gulf of Mexico       | 3,160            |
| Missouri .....      | Mississippi River    | 3,000            |
| Congo .....         | Atlantic             | 3,000            |
| Lena .....          | Arctic Sea           | 3,000            |
| Niger .....         | Gulf of Guinea       | 2,900            |
| Obi .....           | Arctic Sea           | 2,700            |
| Hoangho .....       | North Pacific        | 2,600            |
| Amur .....          | "                    | 2,500            |
| Paraná .....        | Atlantic             | 2,450            |
| Volga .....         | Caspian Sea          | 2,400            |
| Mackenzie .....     | Beaufort Sea         | 2,300            |
| La Plata .....      | South Atlantic       | 2,300            |
| Yukon .....         | Behring Sea          | 2,000            |
| Arkansas .....      | Mississippi          | 2,000            |
| Madeira .....       | Amazon               | 2,000            |
| St. Lawrence .....  | Gulf of St. Lawrence | 1,800            |
| Rio del Norte ..... | Gulf of Mexico       | 1,800            |
| Sao Francisco ..... | Atlantic             | 1,800            |
| Danube .....        | Black Sea            | 1,795            |
| Euphrates .....     | Persian Gulf         | 1,700            |
| Indus .....         | Arabian Sea          | 1,700            |
| Brahmaputra .....   | Bay of Bengal        | 1,680            |
| Zambesi .....       | Mozambique           | 1,600            |
| Ganges .....        | Bay of Bengal        | 1,600            |

† The most famous river falls are Niagara, between the Province of Ontario and New York State, on the Niagara River; the Victoria Falls on the Zambesi River; and the series of falls on the Merced River in the Yosemite Valley in California.

## THE LARGEST SHIPS.

| Ship.                                | Tons.  | Dimensions (ft.) |
|--------------------------------------|--------|------------------|
| Majestic (x) .....                   | 55,000 | 912 X 100 X 57   |
| Leviathan (x) .....                  | 54,888 | 907 X 100 X 57   |
| Berengaria (x) .....                 | 53,088 | 882 X 98 X 58    |
| Olympic (x) .....                    | 45,359 | 854 X 98 X 59    |
| Aquitania (x) .....                  | 45,647 | 868 X 97 X 49    |
| Columbus (a) .....                   | 35,000 | 750 X 83 X 48    |
| Paris (a) .....                      | 34,000 | 734 X 85 X 59    |
| Mauretania (x) .....                 | 30,704 | 764 X 88 X 57    |
| George Washington (a) ..             | 25,570 | 699 X 78 X 50    |
| Kaiserin Augusta }<br>Victoria (x) } | 24,581 | 677 X 77 X 50    |
| Belgic (x) .....                     | 24,547 | 670 X 78 X 44    |
| Adriatic (x) .....                   | 24,541 | 709 X 75 X 52    |
| Rotterdam (4) .....                  | 24,149 | 605 X 77 X 43    |
| Baltic (x) .....                     | 23,876 | 709 X 75 X 52    |
| France (3) .....                     | 23,666 | 680 X 75 X 48    |
| America (a) .....                    | 22,688 | 668 X 74 X 47    |
| Duillio (s) .....                    | 22,000 | 601 X 75 X 50    |
| Gulio Cesare (5) .....               | 21,500 | 601 X 76 X 51    |
| Celtic (x) .....                     | 21,040 | 680 X 75 X 44    |
| Celtic (x) .....                     | 20,904 | 680 X 75 X 44    |
| Minnesota (a) .....                  | 20,602 | 622 X 73 X 41    |
| Cap Polonia (x) .....                | 20,597 | 637 X 72 X 39    |

LANGUAGES OF THE WORLD.  
OF THE 1,646,000,000 inhabitants of the globe about 600,000,000 speak the principal European tongues, of which English has the largest number of adherents through the predominance of that tongue in the United States of America and in the British Dominions.

| Language         | People.     |
|------------------|-------------|
| English .....    | 160,000,000 |
| German .....     | 100,000,000 |
| Russian .....    | 100,000,000 |
| French .....     | 70,000,000  |
| Spanish .....    | 50,000,000  |
| Italian .....    | 50,000,000  |
| Portuguese ..... | 25,000,000  |

## THE LONGEST BRIDGES.

| Name.               | Country.            | Length, Miles. Yds. |
|---------------------|---------------------|---------------------|
| Tay .....           | Scotland .....      | 2 73                |
| Ohio .....          | United States ..... | 2 —                 |
| Bone (Dahrl) .....  | India .....         | 1 1,591             |
| Victoria .....      | Canada .....        | 1 1,320             |
| Godavari .....      | India .....         | 1 1,273             |
| Forth .....         | Scotland .....      | 1 1,005             |
| Missouri .....      | United States ..... | 1 784               |

A considerable number of vessels, which are not yet completed, appear in the Register Book and are therefore included in this Table.

Vessels trading on the Caspian Sea, and Wood vessels trading on the Great Lakes of North America, are not included.

In the absence of satisfactory information, the records of most of the Sailing vessels belonging to Greece, Turkey, and Southern Russia, are omitted from the Register Book and therefore do not appear in this Table.

Japanese Sailing vessels are not recorded in Lloyd's Register Book and therefore do not appear in this Table.

Under the heading of "No flag recorded" are included all vessels entered in the Register Book without record of flag. viz: (a) Ex-German steamers of 260 tons gross and above, the construction of which is not yet known, and a number of ex-Austro-Hungarian vessels inserted in the Register Book as being registered at Fiume or ports south of Fiume.

(b) Vessels registered at Danzig and Mowla. (c) Some other vessels regarding which no definite information has been received up to the time of going to press.

## The League of Nations.

ONE of the results of the War of 1914-1918 was the formation of a League of Nations, with a Covenant, and a Charter of XXVI Articles.

The High Contracting Parties agreed to the Covenant in order to promote International Co-operation and to achieve International Peace and Security, by the acceptance of obligations not to resort to War

"by the prescription of open, just and honourable relations between Nations;

by the firm establishment of the understandings of International Law as the actual rule of conduct among Governments;

and by the maintenance of justice and a scrupulous regard for all Treaty Obligations in the dealings of Organized Peoples with one another."

The territorial integrity and existing political independence of all members of the League is guaranteed by Article X of the Covenant. In case of any dispute between members, likely to lead to a rupture, they will submit the matter to arbitration or enquiry, and agree not to resort to war until three months after the award by the arbitrator or the report by the Council, such award to be made within a reasonable time, and such report to be made within six months of the submission of the matter in dispute. Any member resorting to war in disregard of these rules shall be deemed to have committed an act of war against all the remaining members of the League, who undertake to subject the aggressor to the severance of all intercourse and trade or financial relations, while the Council of the League shall recommend to the Governments concerned what effective force shall be contributed by each to protect the covenants of the League.

In the event of a dispute between a member of the League and a State which is not a member (or between States that are not members) invitation shall be made to the State or States that are not members to accept membership, with its privileges and obligations. If the invitation be refused, and the State that is not a member resort to war against a member of the League, such State shall be deemed to have made war on every member of the League and shall be so dealt with. If the invitation be refused by States that are not members, the Council shall take such steps as may be possible to avert hostilities and to settle the dispute.

Article XXIII provides for securing fair and humane conditions of labour for men, women and children in the countries of members, and in those in which members have commercial and industrial relations, and provides for the just treatment of natives; for the suppression of the "White Slave" traffic; for the supervision of the traffic in opium and dangerous drugs, and in arms and ammunition; for the freedom of communications and trade between members, and for the prevention and control of disease.

The formation of the League was very largely the work of Woodrow Wilson, President of the United States of America 1913-21, but his action in committing the United States to participation in the League was repudiated by the Foreign Relations Committee of the Senate of the U.S. and was not endorsed by the electors in the Presidential Election of 1920.

The Council of the League consists of representatives of the British Empire, France, Italy

and Japan, together with representatives of four other members of the League selected by the Assembly of Representatives of the members of the League. Any member of the League not represented on the Council shall be invited to send a representative to sit as a member of the Council during the consideration of matters specially affecting the interests of that member of the League.

The original members of the League were the Signatories of the Treaty of Peace at Versailles on behalf of the Allies, June 28, 1919, such signatories being indicated by an asterisk (\*) in the following list, but the *United States*, *Ecuador* and *The Hedjaz* (whose representatives signed the Treaty) did not send delegates to Geneva, while the *Argentine* representatives withdrew, after protesting against the provisions of Article X of the Covenant.

The following Nations were represented at the First Assembly of the League of Nations at Geneva, Dec., 1920.

|                 |              |                 |
|-----------------|--------------|-----------------|
| *Argentina      | *Greece      | *Peru           |
| *Australia      | *Guatemala   | *Poland         |
| *Belgium        | *Haiti       | *Portugal       |
| *Bolivia        | *Honduras    | *Rumania        |
| *Brazil         | *India       | Salvador        |
| *British Empire | *Italy       | *Siam           |
| *Canada         | *Japan       | Spain           |
| Chile           | *Liberia     | Sweden          |
| *China          | Netherlands  | Switzerland     |
| Columbia        | *New Zealand | *Union of South |
| *Cuba           | *Nicaragua   | Africa          |
| *Czecho         | Norway       | *Uruguay        |
| Slovakia        | *Panama      | Venezuela       |
| Denmark         | Paraguay     | *Yugo-Slavia    |
| *France         | Persia       |                 |

Any fully self-governing State, Dominion or Colony, not named as an Original Member, may become a member of the League if its admission is agreed to by two-thirds of the Assembly.

Albania, Austria, Costa Rica, Finland and Luxemburg were admitted to membership during the Geneva meeting of Dec., 1920, and Esthonia, Latvia and Lithuania at the meeting of Sept., 1921.

Any member of the League may, after two years' notice of its intention to do so, withdraw from the League, provided that all its international obligations, and all its obligations under the Covenant, shall have been fulfilled at the time of its withdrawal.

In July 1922 the League had a membership of 48 States and an expenditure of £1,062,500, towards which Great Britain contributed £52,000.

In Oct. 1921, the Council of the League determined the question of the boundaries of Upper Silesia, referred to the League by the Supreme Council of the Allies.

President (1921), M. Paul Hymans.

Secretary-General, Hon. Sir Eric Drummond, K.C.M.G., C.B. (and entertainment allowance £6,000)

Financial Director, Sir Herbert B. Ames, LL.D.  
Director, International Labour Office, M. Albert Thomas.

LEAGUE OF NATIONS UNION, 25, Grosvenor Crescent, S.W. 1.—President, Viscount Grey of Fallodon, K.G.; General Sec., J. C. Maxwell Garnett.

† Argentina withdrew, after admission.

NOTES.—† Died in office.    § Assassinated.    (a) Elected as VICE-President.

GEORGE III. was the eldest son of Frederick, Prince of Wales (eldest son of George II.), and of Princess Augusta (youngest daughter of Frederick, Duke of Saxe-Coburg-Gotha). His Majesty was born at Norfolk House, St. James's Square, June 4, 1738; succeeded to the Throne Oct. 25, 1760; married Princess Charlotte (daughter of Charles, Duke of Mecklenburg-Strelitz); and was crowned with her on Sept. 22, 1761. The government was carried on, from Feb. 5, 1811, until the death of King George III., by his eldest son George, under the title of *Prince Regent*. King George III. died at Windsor, Jan. 29, 1820. his issue being:—

1. GEORGE IV. George Augustus Frederick, *Prince of Wales*, born Aug. 12, 1762, married Princess Caroline of Brunswick, succeeded to the Throne, Jan. 29, 1820, and died without surviving issue June 26, 1830.

2. Frederick, *Duke of York and Albany*, born Aug. 16, 1763, married Princess Frederica of Prussia, was for many years Commander-in-Chief of the Army, and died without issue Jan. 5, 1827.

3. WILLIAM IV. William, *Duke of Clarence*, born Aug. 21, 1765; was Lord High Admiral of England; married July 11, 1818, Adelaide, daughter of George, Duke of Saxe-Meiningen, by whom he had two daughters, who predeceased him; succeeded to the Throne, June 26, 1830, and died June 20, 1837.

4. Charlotte, *Princess Royal*, born Sept. 29, 1766, married Frederick, King of Wurttemberg, and died without issue.

5. Edward, *Duke of Kent*, born Nov. 2, 1767, married Princess Victoria (daughter of Francis, Duke of Saxe-Coburg, and widow of Charles, Prince of Leiningen), died Jan. 23, 1820. Their Royal Highnesses had issue a daughter, Princess Victoria, born May 24, 1819, who succeeded to the Throne as QUEEN VICTORIA, June 20, 1837.

6. Augusta, born Nov. 8, 1768, died unmarried Sept. 23, 1840.

7. Elizabeth, born May 22, 1770, married Frederick, Landgrave of Hesse, and died without issue Jan. 10, 1840.

8. KING OF HANOVER. Ernest, *Duke of Cumberland*, born June 5, 1771, married Frederica (daughter of Frederick V., Grand Duke of Mecklenburg-Strelitz), succeeded as King of Hanover June 20, 1837 (on death of William IV., owing to the exclusion of Queen Victoria by the provisions of the Salic Law), died Nov. 28, 1851.

9. Augustus, *Duke of Sussex*, born Jan 27, 1773, died without succession April 24, 1843.

10. Adolphus, *Duke of Cambridge*, born Feb. 24, 1774, married Princess Augusta (daughter of Frederick, Landgrave of Hesse), see below.

11. Mary, born April 25, 1776, married William Frederick, *Duke of Gloucester*, died without issue April 30, 1857.

12. Sophia, born Nov. 3, 1777, died unmarried May 27, 1848.

13. Octavius, born Feb. 23, 1779, died May 3, 1783.

14. Alfred, born Sept. 22, 1780, died Aug. 26, 1782.

15. Amelia, born Aug. 7, 1783, died unmarried Nov. 2, 1820.

DESCENDANTS OF H.R.H. ADOLPHUS, DUKE OF CAMBRIDGE, born Feb. 24, 1774, died July 8, 1850.

1. H.R.H. Prince George, *Duke of Cambridge*, born March 26, 1819, Field-Marshal, Commander-in-Chief of the British Army, 1856-1859, died without succession March 17, 1904.

2. H.R.H. Princess Augusta, born July 19, 1822, married the Grand Duke of Mecklenburg-Strelitz.

**ANNUITIES TO THE ROYAL FAMILY.**

The annuities payable to Their Majesties and to the members of the Royal Family are known as the *Civil List*, which is granted by Parliament upon the recommendation of a Select Committee. The Civil List of King Edward VII. amounted to £470,000, in addition to which annuities to other members of the Royal Family accounted for an additional annual sum of £106,000. The Select Committee appointed on June 14, 1910, reported on July 7, and made the following recommendations, which were adopted by the House of Commons:—

|                                    |                 |   |         |
|------------------------------------|-----------------|---|---------|
| Their Majesties' Privy Purse ..... | £120,000        | Queen Alexandra .....                     | £70,000 |
| Salaries of Household .....        | 125,800         | Princess Christian .....                  | 6,000   |
| Expenses of Household .....        | 193,000         | Princess Louise (Duchess of Argyll) ..... | 6,000   |
| Works .....                        | 20,000          | Duke of Connaught .....                   | 25,000  |
| Royal Bounty .....                 | 13,200          | Duchess of Albany .....                   | 6,000   |
| Unappropriated .....               | 8,000           | Princess Beatrice .....                   | 6,000   |
|                                    |                 | King Edward VII.'s Daughters .....        | 12,000  |
|                                    | <b>£470,000</b> |   |         |

IN a broad sense this heading is commonly taken as identical with that of the House of Lords, although there are close upon 130 holders of titles of long-standing nobility who are not members of the Upper House of Parliament, their peerages being those of Scotland or Ireland only. But there are about an equal number of Peers of those kingdoms who possess additional titles which constitute them members of the House of Lords, these titles being in a majority of instances, though very far from all, inferior to those by which they are generally known. The full details as to each are given under his leading title, and a reference is in every case supplied under any other that he may hold, so that the table of equivalent titles formerly given in this work is no longer needed: a double index will be found in "WHITAKER'S PEERAGE, BARONETAGE, KNIGHTAGE AND COMPANIONAGE."

**Contractions.**—S. or I. appended to the date of creation denotes a *Scottish* or *Irish* title; the further addition of a \* implies that the Peer in question holds also an Imperial title, which is specified (after the name) by its more definite description as *Engl.*, *Brit.*, or *U.K.* When both titles are alike, as in the case of Argyll, this star is appended to the conjoined date below, and it then denotes that such date is that of the Imperial creation. A † appended to S. or I. implies that the Peer is an elected Representative to the House of Lords. For the mark ° see heading to Marquesses; b., signifies born; s., succeeded; m., married; w., widower or widow; div., divorced; M., minor.

## COMPLETE LIST OF THE PEERS.

**ROYAL DUKES (3).**—*Style*, His Royal Highness the Duke of —. *Addressed as*, Sir, or more formally, May it please your Royal Highness.

## Courtesy Titles borne by Eldest Sons of Dukes, &c. 147

*From this list it will be seen that "Lord Aberdour" is the heir to the Earldom of Morton (see p. 134) and that "Viscount Curzon, M.P.," is the eldest son of Earl Howe (see p. 133): \* the titles borne by second heirs are also given, e.g. Earl of Burlington, eldest son of the Marquess of Hartington, heir apparent of the Duke of Devonshire.*

**THE ORDER OF MERIT (1802)—O.M. Ribbon, Blue and Crimson.**

This Order confers no precedence, but authorizes the holders to place its designating initials next after those denoting membership of Grand Cross of the Order of the Bath. It is designed as a special distinction for eminent men and women—without in itself conferring a knighthood. The Order is limited in numbers to 24, with the addition of foreign honorary members. Membership is of two kinds, Military and Civil, the badge of the former having crossed swords, and the latter oak leaves. Membership is designated by the suffix O.M., which is authorized to follow the first class of the Order of the Bath and to precede the letters designating membership of the inferior classes of the Bath and all classes of the remaining Orders of Knighthood.

**MILITARY MEMBERS.**

*Admiral of the Fleet* Rt. Hon. Sir Edward Hobart Seymour, G.C.B., K.C.V.O.

*Field-Marshal* Rt. Hon. Earl French, K.P., G.C.B., K.C.V.O.

*Admiral of the Fleet* Rt. Hon. Viscount Jellicoe, G.C.B., K.C.V.O.

*Field-Marshal* Rt. Hon. Earl Haig, K.T., G.C.B., K.C.V.O., K.C.I.E.

*Admiral of the Fleet* Rt. Hon. Earl Beatty, G.C.B., K.C.V.O., D.S.O.

**CIVIL MEMBERS.**

Rt. Hon. Viscount Morley of Blackburn, F.R.S.

Rt. Hon. Viscount Bryce, F.R.S.

Thomas Hardy, Litt.D., LL.D.

Rt. Hon. Sir George Otto Trevelyan, Bart.

Sir Edward Elgar, Mus. Doc.

Sir Joseph John Thomson, F.R.S.

Sir Archibald Geikie, K.C.B., F.R.S.

Rt. Hon. Viscount Haldane, K.T.

Rt. Hon. Arthur James Balfour.

Rt. Hon. David Lloyd George.

**HONORARY MEMBERS.**

*Field-Marshal* Prince Yamagata.

*Admiral* Count Togo.

*Field-Marshal (Marshal of France)* Ferdinand Foch.

*Marshal* Joseph Jacques Césaire Joffre, G.C.B.

*Secretary and Registrar.* Col. Hon. Sir Henry Charles Legge, K.C.V.O.

*Ribbon.* Blue, with Red and White Edges.

**THE SOVEREIGN.** *Chancellor.* The Lord Chamberlain; **Secretary.** The Keeper of His Majesty's Privy Purse; **Registrar.** Sir Francis M. Bryant, *c.m.g.*, *m.v.o.*, *i.s.o.*—G.C.V.O., Knight Grand Cross; K.C.V.O., Knight Commander; C.V.O., Commander; M.V.O., Member, marked 4th or 5th Class.

K.C.V.O.

## THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (1917).

*Ribbon.* Purple (Civil Division); Purple, with Red Centre Stripe (Military Division).

**THE SOVEREIGN.** *Grand Master.* H. R. H. the Prince of Wales; **Prelate.** Rt. Rev. the Bishop of London; **King of Arms.** Gen. Rt. Hon. Sir Arthur H. F. Paget, *c.m.g.*, *m.v.o.*; **Registrar.** The Comptroller of the Lord Chamberlain's Dept. (ex officio); **Secretary.** The Permanent Under-Sec. of State for Home Dept. (ex officio); **Gentleman Usher of the Purple Rod.** Sir Frederic G. Kenyon, *k.c.m.g.* For services rendered to the Empire, whether at home or abroad, open to both men and women. *a.m.g.*, Knights Grand Cross or Dames Grand Cross; *k.m.g.*, Knights Commanders; *b.m.g.*, Dames Commanders; *c.m.g.*, Commanders; *o.m.g.*, Officers, *m.m.g.*, Members. The Order was divided into *Military* and *Civil* divisions in Dec., 1918.

## ORDER OF THE COMPANIONS OF HONOUR (1917)—O.H.

*Ribbon.* Carmine, with Gold Edges.

This Order consists of one Class only and carries with it no title or precedence, but ranks after the 1st Class of the Order of the British Empire, i.e., Kts. Grand Cross (Mil. and Civ. Div.). The number of awards is limited and is open to both sexes.

## THE DISTINGUISHED SERVICE ORDER (1886)—D.S.O.

*Ribbon.* Red, with Blue Edges.

Bestowed in recognition of special services in action of commissioned officers in the Navy, Army and Royal Air Force. The members are Companions only and rank immediately before the 4th Class of the Royal Victorian Order. A Bar may be awarded for any additional act of service.

## THE IMPERIAL SERVICE ORDER (1902, enlarged 1912)—I.S.O.

*Ribbon.* Crimson, with Blue Centre.

Restricted to members of the administrative or clerical (clerk) branches of the Civil Service, and consists of the **SOVEREIGN**, the Prince of Wales, and Companions (not exclusively male) to a number not exceeding 700, of whom 250 may belong to the Home Services, 200 to the Indian (200 European and 100 Indian) and 250 to the services of Dominions, Colonies and Protectorates.

## THE ROYAL ORDER OF VICTORIA AND ALBERT (for Ladies)—V.A.

*Ribbon.* White Moiré.

Instituted in 1862, and enlarged in 1864, 1865, and 1880, but no fresh conferments are now made.

## THE IMPERIAL ORDER OF THE CROWN OF INDIA (for Ladies)—C.I.

Instituted 1876.

*Ribbon.* Light Blue, with White Edges.

## THE ORDER OF ST. JOHN OF JERUSALEM.

*Ribbon.* Black.

The Order had its origin in Jerusalem and Acre, as an international lay confraternity for the relief of crusaders, and was later sovereign in Rhodes and in Malta, where its Knights kept galleys and galleons, to attack the Barbary Corsairs and to prevent the spread of Turkish rule in the Mediterranean, from 1530 till 1798. The work of the British Order is the control of the St. John's Ambulance and Brigades, and of the British Ophthalmic Hospital, Jerusalem. **Sovereign Head and Patron.** H. M. King George V.; **Grand Prior.** H. R. H. Duke of Connaught, and Strathmore; **Secretary-General.** Lord Stanmore, **Chaplain-General.** the "Knights of Justice" and selected "Chaplains," "Knights of Grace" and "Esquires." There are also "Ladies of Justice," "Ladies of Grace," and Esquires. These distinctions are notified in the *London Gazette*, but do not confer any rank or title.

## METEOROLOGICAL NOTES AND RECORDS.

**BRITISH ISLANDS:** The maximum temperature of the air recorded in the shade at 4 feet above the ground is 100° Fahr. This was observed at Wilton House, Salisbury, on July 15, 1881, and at Greenwich Observatory on Aug. 9, 1911.

The lowest temperature of the air recorded in the shade at 4 feet above the ground is—25° Fahr., or 5° below freezing point, at Black-ash, Berwickshire, on Jan. 17, 1881.

The greatest rain/fall in a day was at Bruton, Somerset, when 9.56 inches fell in the 24 hours ended 9 a.m., June 29, 1907. This rainfall is equal to 955 tons of water per acre.

The total rain/fall for a year at Stations in the British Islands during the 30 years 1884 to 1913

ranged from 40.05 inches at the summit of Ben Nevis in 1898 to 12.02 inches at Chatteris, Cambs, in 1884.

The maximum wind-velocity on record in the British Islands was recorded at Quilly, west coast of Ireland, on Jan. 27, 1900, when a gust exceeded the rate of 120 miles per hour.

**GENERAL:** The maximum temperature on record of the air in shade is 134° Fahr., observed at Greenland Ranch, California, on July 10, 1913.

The wettest station in the world is generally allowed to be Cherra Poonjee in Assam, where the total fall for the year has exceeded 55½ inches. From June 12 to 16, 1896, 12½ inches was collected, or an average daily fall of 2½ inches. On one of these days, June 14, 40.80 inches fell in 24 hours.

## Knights Bachelor.

The Knights Bachelor do not constitute a Royal Order, but comprise the surviving representation of the ancient State Orders of Knighthood. The Register of Knights Bachelor, instituted by James I. in the 17th century, lapsed, and in 1802 a voluntary association under the title of "The Society of Knights" (now "The Imperial Society of Knights Bachelor" by Royal command) was formed with the primary objects of continuing the various registers dating from 1567 and obtaining the uniform registration of every created Knight. An annual Knightage is published from information supplied by the authorities, and can be obtained on application. The Officers of the Society are:—*Principal*, Sir Henry Pellatt, Kt., C.V.O.; *Vice-Principal*, Sir William Bull, Kt., M.P.; *Hon. Registrar*, Sir Harry North; *Clerk*, H. Wheelbourn; *Registry and Library*, a Mitre Court, Temple, E.C. 4.

**A LIST OF THE GENTLEMEN WHO HAVE RECEIVED THE HONOUR OF KNIGHTHOOD.**  
(Exclusive of such as have afterwards received the higher honour of K.C.B., etc., q.v.)

- Abdul Hussain Sahib, Khan Bahadur, Sir  
Abdur Rahim, Hon. Sir  
Acland, Sir K. B. Dyke, K.C.  
Acton, Hon. Sir Edward.  
Acworth, Sir Wm. Mitchell  
Adams, Sir John Ooole.  
Adkins, Sir Ryland, C.M.P.  
Adcock, Sir J. Ormiston, M.D.  
Aikins, Sir James A. M.  
Aird, Sir John.  
Aitken, Sir Robert.  
Alcock, Sir Hy. Albert, K.C.  
Alexander, Sir Sidney K.

### \* Table of Precedency in the United Kingdom.

|  |  |  |
|--|--|--|
| The Sovereign.   | All other English Bishops, according to their seniority of Consecration.                 | Eldest Sons of Knights in order of their Fathers.  |
| The Prince of Wales.   | Five above State Officers if Barons.   | <i>M.V.O.(5th); M.E.E.</i>   |
| Younger Sons of the Sovereign.                                     | Secretaries of State, if of the degree of a Baron.                                       | Younger Sons of the younger Sons of Peers.   |
| Grandsons of the Sovereign.  | Barons, in same order as Dukes.  | Baronets' younger Sons.  |
| Sovereign's Brothers.  | Treasurer of H.M.'s Household.   | Younger Sons of Knights in the same order as their Fathers.  |
| Sovereign's Uncles.  | Comptroller of H.M.'s Household.   | Naval, Military, and other Esquires by Office.   |
| Sovereign's Nephews.   | Vice Chamberlain of Household.   |  |
| Ambassadors.   | Secretaries of State under the degree of Baron.  |  |
| Archbishop of Canterbury.  | Viscounts' eldest Sons.  | Women take the same rank as their husbands or as their eldest brothers; but the daughter of a Peer marrying a Commoner retains her title as Lady or Honourable. Daughters of Peers rank next immediately after the wives of their elder brothers, and before their younger brothers' wives.      |
| Lord High Chancellor.  | Earls' younger Sons.   | Daughters of Peers marrying Peers of lower degree take the same order of precedence as that of their husbands; thus the daughter of a Duke marrying a Baron degrades to the rank of Baroness only, while her sisters married to commoners retain their rank and take precedence of the Baroness. |
| Archbishop of York.  | Barons' eldest Sons.   | Merely official rank on the husband's part does not give any similar precedence to the wife.*  |
| Prime Minister.  | Knights of the Garter if Commoners.  |  |
| Lord Chancellor of Ireland.  | Privy Counsellors if of no higher rank.  |  |
| Lord President of the Council.                                     | Chancellor of the Exchequer.   |  |
| Speaker of the House of Commons.                                   | Chancellor of the Duchy of Lancaster.  |  |
| Lord Privy Seal (if of Baronial rank).                             | Lord Chief Justice of England.   |  |
| Five following State Officers if Dukes:                            | Master of the Rolls.   |  |
| (1) Lord Great Chamberlain (on duty)                               | The Lords Justices of Appeal and President of the Probate Court.                         |  |
| (2) Earl Marshal.  | Judges of the High Court.  |  |
| (3) Lord Steward.  | Viscounts' younger Sons.   |  |
| (4) Lord Chamberlain.  | Barons' younger Sons.  |  |
| (5) The Master of the Horse.                                       | Sons of Life Peers.  |  |
| Dukes, according to their Patents of Creation:                     | Baronets of either Kingdom, according to date of Patent.                                 |  |
| 1. of England; 2. of Scotland; 3. of Great Britain; 4. of Ireland; | Knights (Grand Cross of the Bath. <i>G.C.B.; G.C.M.G.; G.C.I.E.; G.C.V.O.; G.S.E.</i> )  |  |

| Earls' eldest Sons.  |  |  |
| Marquesses' younger Sons.  |  |  |
| Bishops of London, Durham and Winchester.                          |  |  |

\* For fuller tables (and for Scottish and Irish Precedency) see Introduction to "WHITAKER'S PEERAGE, BARONETAGE, KNIGHTAGE AND COMPANIONAGE," a companion volume, price 5s. net.

THE VICTORIA CROSS. *V.C.*

Ribbon, Crimson for all Services.

FOR CONSPICUOUS BRAVERY. INSTITUTED 26th January, 1856.

Instituted in 1856, on the close of the Crimean War, and extended to civilians who had borne arms against the Indian mutineers. In 1912 the decoration was extended to the Indian Army. A bar may be awarded for any additional act of gallantry.

**The Distinguished Service Cross.**—1914.—D.S.C.—In substitution for the Conspicuous Service Cross, 1901, is designed for bestowal on all officers of the R.N. below the rank of Lieutenant-Commander

**The Military Cross.**—1915.—M.C.—Awarded to Captains, Lieutenants, and 1st class Warrant Officers in the Army and Indian and Colonial Forces.

**The Distinguished Flying Cross.**—1918.—D.F.C.—Designed for bestowal upon officers in the Royal Air Force for acts of gallantry when flying in active operations against the enemy.

**The Air Force Cross.**—1918.—A.F.C.—Instituted as preceding, but for acts of courage or devotion to duty when flying, although not in active operations against the enemy.

**The Military Medal.**—1915.—M.M.—Awarded to non-commissioned officers and men for individual or associated acts of bravery in the field. In exceptional circumstances the Medal may be awarded to women of all nations.

**The Distinguished Service Medal.**—1914.—D.S.M.—Is designated for chief petty officers, petty officers, men, and boys of all branches of the R.N.; to non-commissioned officers and men of the R.M.A.; and to all other persons holding corresponding positions in His Majesty's Service afloat, for distinguished conduct in war.

**The Distinguished Flying Medal.**—1918.—D.F.M.—and the Air Force Medal, for warrant and non-commissioned officers and men for equivalent services as for D.F.C. and A.F.C.

**The Conspicuous Gallantry Medal.**—C.G.M.—Is bestowed upon warrant officers and men of the R.N.

**The Distinguished Conduct Medal.**—D.C.M.—Awarded to warrant officers, non-commissioned officers, and men of the Army.

**The Volunteer Officers' Decoration.**—V.D.—Was an honour for rewarding the meritorious services of officers of the force in question, who must have been in commission and have served twenty years

**The Territorial Decoration.**—T.D.—Established in 1908, is restricted to commissioned officers of twenty years' good service in the Territorial Force, and not holders of the Volunteer Decoration. Similarly a Territorial Long Service Medal has been substituted for that formerly awarded to Volunteers.

**The Royal Red Cross.**—R.R.C.—For ladies, founded 1898, is a distinction conferred upon ladies of any rank or nation who may be brought to the Sovereign's notice for acts of mercy in attending to the sick or wounded in time of war.

**The Order of Mercy.**—Both sexes; was established in 1899 in connexion with the League of Mercy, an institution also founded in 1899 to promote the welfare of hospitals by obtaining small subscriptions for King Edward's Hospital Fund for London, &c.

**The Indian Order of Merit.**—Instituted in 1899, as a reward for personal bravery, to Indian officers and men.

**The Kaiser-Blind Medal.**—Was founded in 1900, and is a reward for any person, of either sex, who shall have rendered useful service in or for India.

**The Albert Medal.**—Dates from 1866, with extensions in 1877 and 1897, and is a recognition of acts of gallantry performed by any person whatever—"For Gallantry in Saving Life at Sea" or "on Land."

\* All the above vacate office on a change of Government.

THE third Parliament of King George V. was elected in December, 1918, and met on February 4, 1919. The General Election had returned 478 supporters of the Coalition (334 Unionists; 133 Liberals; 11 Labour) and 229 Non-Coalition (63 Labour; 48 Unionists; 28 Liberals; 73 Sinn Feiners; 7 Nationalists; and 10 Independents), distributed as shown in the following table:—

|                    | DISTRIBUTION OF MEMBERS. |           |               |                | PARTY STRENGTH (Jan., 1919). |                |                |
|--------------------|--------------------------|-----------|---------------|----------------|------------------------------|----------------|----------------|
|                    | Counties.                | Boroughs. | Universities. | Total Members. | Coalition.                   | Non-Coalition. | Majority.      |
| England .....      | 230                      | 255       | 7             | 492            | 401                          | 91             | 310 Coalition. |
| Wales .....        | 24                       | 11        | 1             | 36             | 21                           | 15             | 6 Coalition.   |
| Scotland .....     | 38                       | 33        | 3             | 74             | 56                           | 18             | 38 Coalition.  |
| Ireland .....      | 80                       | 21        | 4             | 105            | —                            | 105            | 105 Non-Co.    |
| United Kingdom ... | 372                      | 320       | 15            | 707            | 478                          | 229            | 249 Coalition. |

Only successful candidates who received the recognition of the Prime Minister and Mr. Bonar Law are included among the supporters of the Coalition. Thus, the Irish Unionists are omitted from the Ministerialists, although, like many other Non-Coalition members, they are in general agreement with the Government.

#### ALPHABETICAL LIST OF MEMBERS OF PARLIAMENT.

The following list gives Surname, Initials, Politics, Key Number of Seat on pp. 223-236, Name of Division, and Majority at Last Election of each of the 707 Members of Parliament.
